Hunting-gathering bands have been erroneously considered by numerous anthropologists to be peaceful. The belief is held so widely that it can be called a myth. Numerous cross-cultural studies, however, have shown that the percentage of warring bands ranges from 75–92%. This result is based on a review of six cross-cultural studies, two of which focused on bands. Peaceful hunter-gatherers, thus, are only 8–25% in these samples. The myth of the peaceful band grew out of evolutionary or developmental theory that arose in the Foundation Period (c. 1850–c. 1920), flourished during the Classical Period (c. 1920–c. 1960), and persisted to the present.

To dissect warfare systems it is necessary to select several key variables or dimensions. The goals of the combatants or the reasons that the military organizations or polities go to war are appropriately examined first. Comparative studies have identified four goals or causes of war: defense (including revenge), plunder (including spouse capture), prestige (for individuals and polity), and political control (which includes either hegemonic or territorial control). These studies show that defense and revenge are universal, if war is present. Defense and revenge are universally found because those who are attacked must respond in some manner: fight, flee, or surrender. And fight, if able, is the first response. The aggressors are likely to attack for one to three reasons: sustenance, sites, or spouses (the plunder goal)—the three Ss of war. Resources, including (according to many cultures) women, are seized, or land is taken for hunting territories, fields for crops, or habitation sites. The goals form a Guttman scale with plunder being more important than prestige; in other words, where

prestige is found plunder is also, but where plunder is found prestige may not be. Thus material reasons for war, although not universal, are nevertheless more commonly found than prestige reasons. Thus, the sequence is defense—revenge, plunder, prestige, and political control. The four goals are related to level of political complexity. Indeed, only centralized political systems go to war for political control.

A second dimension is the composition of the military organization. How much training have the combatants had? Are the weapons used in armed combat hunting weapons or are they specialized weapons that require specialized training, often used in conjunction with other combatants? Otterbein has distinguished between nonprofessional and professional military personnel on the basis of whether they are part-time or full-time. The vast majority of small-scale societies (bands, tribes, and chiefdoms) have military organizations composed only of nonprofessionals, although some tribes and chiefdoms have full-time personnel. The backbone of nonprofessional military organizations is likely to be fraternal interest groups or localized groups of related males. On the other hand, the military organizations of states will most likely be composed of professionals. Officers are usually members of the upper class of the society. The commander-in-chief is usually the monarch. Commoners become full-time through conscription. If going to war is successful, the seized resources are likely to go almost entirely to the officers, the upper class, and the ruler. Fortified capitals and palaces are likely to follow. At this level of political complexity, defeat of a political community usually results in slavery of the commoners and execution of the upper class and royalty.

A third dimension is tactics. Basic tactics include ambushes, line battles, and sieges. Ambushes encompass two types of formations: surrounding enemy (in camp or settlement) or laying trap (along a path or road). "A detailed analysis of numerous cases over the past 30 years suggests that the ambush is probably used by all warring societies" (Otterbein). Ambush is perhaps a universal. Line battles may be arranged battles (the time and place negotiated in advance) or encounter battles. An attempted ambush may turn into an encounter battle if the intended victims detect the attacking military organization and stand their ground. For example, the Pearl Harbor attack was a successful ambush, but the attack on Midway Island was detected and the

advancing Japanese navy was attacked and defeated. Sieges occur when the military organization of the inhabitants of a settlement, large or small, fortify and defend the settlement and the attackers devise means to overcome the defenses.

As noted, comparing warfare systems is difficult. There seems, however, to be "a two-component warfare pattern for bands and tribes (ambushes and lines) and a two-component warfare pattern for chiefdoms and states (battles and sieges)" (Otterbein). These two basic patterns appear to have separate origins.

A fourth dimension is gender relations. Political scientist Jonathan Goldstein in a survey of archaeologically and ethnographically known societies found, in spite of great differences in the manner in which war is waged, that gender relations were consistent across cultures. Men were the warriors, women seldom were. He reviews various theories and concludes that although the greater size and strength of men is a factor, the necessity of having role differentiation in a society leads to a classification of men as defender—providers and women as caretakers and food preparers. Men are socialized into the former role, women the latter. In combat men denigrate their opponents by classifying them in the female role.

Of the many theories of war proposed by anthropologists, cultural anthropologists seem to prefer five. They are efficient or proximate cause theories (for a review of theories see Otterbein). The goals of war theory has already been described. *Innate aggression theory*, although strongly attacked in the 1960s and 1970s, has a resiliency that keeps it alive. Cultural anthropologists of the time thought they had refuted the theory that war was in our genes. Studies in sociobiology since 1975 and observations of chimpanzee bands attacking one another have given renewed emphasis to the idea that perhaps the common ancestor of both early man and the chimps was a Killer Ape. *Frustration—aggression theory* also has never died. Perhaps the most acceptable version is that a "challenge elicits aggressive response." A challenge is a frustration. It is typically a challenge to either or both the individual man's status within a group or to his access to women or to other important resources, such as food and shelter. Sustenance, sites, and spouses, recall, seem to be the three basic reasons for war. Fraternal interest groups, the key component in nonprofessional military organizations, have been shown to be responsible for internal war. This social structural approach arose out of research on feuding.

Military preparation itself also seems to be a significant factor in generating warfare.

WAR, ARCHAEOLOGY OF

The study of warfare in prehistory is a specialty of its own embedded within the anthropology of war. To study prehistoric warfare requires knowledge of the conceptual and theoretical ideas set forth in the entries for “Feuding” and “War, Anthropology of,” as well as an awareness of how to apply this knowledge to the archeological record. Because warfare is distinct from violence and feuding, which occur within political communities, the first task of the archaeologist is to identify the polities within a region and attempt to ascertain their relationships to each other. The notion of a *warfare system* is useful here. Hence, a regional approach is preferable to a focus upon a single site. In taking a regional approach, the archaeologist will determine settlement location and movement, which settlements have expanded and which have contracted in size, and which have fissioned and which have coalesced. This is a first step toward

developing an understanding of whether intergroup relations were peaceful or hostile.

Determining the presence of warfare from archaeological finds is complicated—indeed, evidence for armed combat (weapons) and homicides (projectile points in bones) may or may not be indications of warfare. What follows is an attempt to give some guidelines. Finding burials with weapons suggests a warrior class; mass graves of homicide victims of both sexes and all ages suggests a surprise attack upon a village; mutilated bodies suggest torture and execution, acts performed upon members of the polity by other members. Special purpose weapons, body armor, and drawings of combat on walls or pottery vessels indicate the presence of warriors or soldiers and military organizations; general purpose weapons, such as spears and bows and arrows, may indicate only the presence of hunting and self-defense. Walls surrounding settlements and settlements located on a hill or in a place that is difficult to find and approach suggest the presence of warfare; hidden homesteads suggest fear of attacks connected to feuds; fortified houses, compounds, and neighborhoods indicate fear of crime, attacks, or of an uprising against the upper or ruling class. A burned settlement may indicate warfare; burned houses, an uprising.

The application of these guidelines to the archaeological record gives evidence that warfare occurred in a number of regions before the rise of agriculture: hunting and gathering bands in the Upper Paleolithic, Northern Australia, and the Archaic of North America engaged in armed combat on occasion. Upper Paleolithic cave paintings depict figures with darts (perhaps launched with spear throwers) or spears protruding from them (executions or battle casualties) as well as warriors shooting projectile weapons at each other (line battles). Projectile points in pelvic bones have been found at a number of sites, the earliest being 20,000 years ago. Burials, including mass burials, of individuals with projectile points lodged in them have been found along the Nile. This is evidence for warfare 14,000 years ago. In Northern Australia, rock art spanning thousands of years depicts three phases of armed combat, from individual combat with boomerangs or spears to battles between 20 to 30 warriors on a side. In North America, numerous skeletons have been uncovered that bear evidence that these early arrivals to the New World were killed with weapons. Kennewick Man had several healed wounds and a spear point embedded in his pelvis. At the Grimes Burial Shelter, a young man died as a result of being stabbed in his chest with a

knife. In Western Tennessee, six individuals were killed with projectile weapons.

As more and more archaeological sites are excavated, the evidence for early armed combat increases. Hunting weapons, spear throwers and bows and arrows, appear to have served as weapons both in the hunt and in war. It also appears that the frequency of lethal encounters increased through time, probably due to increasing population, increasing encounters between bands, and perhaps increasing competition for resources. Large game animals were on the decline in both Europe and North America during this period due to overhunting and climate change.

Shifting to those regions where agriculture arose—the Near East, North China, Mesoamerica, and Peru—presents a different picture: No evidence of warfare is found at the earliest sites. For example, at Abu Hureyra (9500 BCE–5000 BCE) on the Upper Euphrates settled gatherers acquired crops and became farmers. The settlement grew to six thousand inhabitants. Yet, during this 4,500 year period there is no evidence for warfare. Only one skeleton with an embedded projectile point was found by archaeologists. Even the famous walls of Jericho were first constructed in a region that presents no other evidence of warfare (8300 BCE), an observation that has led some archaeologists to conclude that the walls were not fortifications. In the four regions where pristine or primary states arose, warfare appears to be absent in the earliest archaeological sequences. Specifically, in Mesopotamia warfare does not occur until the Uruk period; in North China, the Longshan period; for the Zapotec of Mesoamerica, the Rosario period; and for the Chavin of Peru warfare does not arise. When warfare did arise in these regions it was late in the Inchoate Early State stage. These early states attacked and conquered other states within a region of culturally similar peoples speaking the same language—internal war. In the Typical Early State stage culturally different peoples were attacked—external war.

The presence of warfare in regions with hunters and gatherers and the absence of warfare in regions of early agriculturalists creates a conundrum. War appears to have disappeared. The absence of warfare in those regions where the first states arose means that villages did not conquer other villages, creating chiefdoms; and chiefdoms did not conquer chiefdoms, creating states. The conquest theory of the origin of the state is not valid.

A solution to this conundrum has been proposed by Otterbein; namely, there are two separate origins

for war. He identifies two types of military organizations, one that developed perhaps two million years ago, certainly by 20,000 years ago, and a second that developed 5,000 years ago. The former is the nonprofessional military organization, based on fraternal interest groups, and the latter the professional, full-time personnel, military organization. Otterbein argues that warfare declined and disappeared in some regions, those regions where large game animals were hunted to extinction. This created settled gatherers who proceeded to domesticate crops in nonwarfare environments. Only after centralized political systems had arisen, along with professional military organizations, did states embark on wars of conquest.

Theories of warfare preferred by archaeologists focus on underlying causes and consequences. Three are favored, creating a limited theoretical pallet available to the archaeologist who is attempting to explain what happened in the past. A favorite theory for many years is the recognition that culture contact leads to diffusion of material culture, specifically weapons, and often the knowledge of how to produce the items. The donor culture may also undergo change, a process known as acculturation. The diffusion–acculturation approach remains a mainstay for archaeologists. Theories featuring the physical environment include sophisticated ecological models, the view that population pressure leads to competition over scarce resources (CSR theory), and recognition that civilizations often come to a catastrophic end because of earthquakes, el Niños, or an ice age. Theories of cultural evolution are also commonly used. The developmental theory of the origin and rise of warfare from no war, to ritual war, to state-level warfare is an example, as is the conquest theory of the origin of the state.

WASHBURN, SHERWOOD L. (1911–2000)

American physical anthropologist Sherwood Washburn's greatest contribution to the field of anthropology was promoting genetics to explain both human variation and as an acting guideline for the basis of a *New Anthropology* (1951). He was also instrumental in both the fields of primatology and forensic anthropology. Born in Cambridge, Massachusetts, to a highly educated and religious family, Washburn's intellectual capabilities and naturalism were encouraged at an early age. Although the young Washburn showed no interest in theology, his father Henry Bradford Washburn, dean of the Episcopal Theological School, encouraged him to explore other academic interests. Cultivating his youthful interests in zoology, and then biology, would later be instrumental in his synthesized anthropological approach. Among the foundational schools of Buckingham, Belmont, and Groton, the director of Belmont, Herber Howe, was a source of particular encouragement and support for Washburn's scientific interests in genetics. Besides his studies while still in high school, he also worked and gained valuable experience at the Harvard Museum of Comparative Zoology. This association with Harvard would accumulate into both an academic and professional relationship, whereby he eventually received both his BA (1935) and PhD (1940) in anthropology. With the profound influence of Harvard's faculty, particularly that of professors Cline, Hooton, Tozzer, and Ward, Washburn's scientific and theoretical framework would solidify and greatly benefit anthropology.

During his professional career, Washburn taught at Harvard, Columbia Medical School, the University of Chicago, and the University of California, Berkeley. With an aggressive and resolved demeanor, he brought both his experience and his wide knowledge base to the classroom. Stressing the scientific method, open to

new scientific evidence and dialogue among all scientists, the resulting dynamic approach would both improve and expedite scientific advancements in all fields of science. As this perspective was applied to the field of anthropology, the resulting inquiry would lead him to the conception of a *New Physical Anthropology*. Besides this theoretical perspective, contributions made by his experiments are also impressive. Due to the nature of his experimentation, the impressive significance of his work with primate anatomy, the effects of paralysis of facial muscles, the significance of muscles for bone growth, and general muscle–bone relationships, the substantial and invaluable knowledge becomes overlooked or minimized. The ethical concerns aside, the information gained during his intellectual pursuits involving anatomy and primate behavior has benefited anthropology. He published an impressive collection of articles and served as a profound book editor. Washburn's most noted publications include *Thinking About Race* (1945), *Social Life of Early Man* (1961), *Classification and Human Evolution* (1963), *Perspectives on Human Evolution* (1968), and *Ape Into Man: A Study of Human Evolution* (1974). Although retired from the halls of academia at the time of his death, Washburn's influence and contributions to physical anthropology remains noteworthy.

Washburn's contributions, as a reflection of his perspectives, encompass a wide array of scientific research and related disciplines. With scientific rigor and rational thought based upon available evidence, Washburn entered the field of anthropology during an unsavory time when anthropology held a less than scientific view of human variation. Although today race is considered a social construct, the influences of Hooton concerning eugenics and purity of races was profound during those days, however misguided and erroneous these views had become. Furthermore, Washburn felt that the application of craniometry and morphology to classify human populations were both outdated and erroneous. Nevertheless, Washburn's interest in genetics led him to understand human variation in terms of genetic populations. This perspective concerning outdated techniques held by physical anthropologists was expressed in his call for a reconstruction of anthropology. Perhaps with foresight concerning the fracturing of the traditional four field approach to anthropology (fifth field when including applied anthropology), Washburn's conceptualization for anthropology's move toward the area of biology would provide a solid foundation, including for the areas of culture.

Although conceived and expressed as a discipline-wide approach, this focus of interest accumulated into the subdiscipline of biological anthropology.

Stemming from his biological perspective within an evolutionary framework, Washburn sought to both establish our own species' relationship among the primates and also to use primate's expressed behavior as essential characteristics of our common hominid ancestors. In this manner, he held that the field of primatology was a practical method to accomplish these ends. In an evolutionary framework, the relationship among the primates holds the key understanding to our origin and ancestral behavior. Using the method of DNA hybridization given by biology, supported by both immunology and molecular methods, he stated that all apes share a common ancestor, whereby the human primate is closer to the chimpanzee and then gorilla. The orangutan and, to a greater extent, the gibbon, are more distant than either chimp or gorilla. When establishing this relationship, the more distant or primitive the relationship becomes the more apt the behavior will reflect that of our shared common ancestors (for example, australopithecines). His interest in primates was not new, although previously anatomy and not behavior had been the point of focus.

Viewing primatology as a subdiscipline of biological anthropology, his research into behavior of primates led to understanding the biological or physiological underpinning of aggressive behavior. Extending this concept in an evolutionary perspective, this aggressive behavior from a functional perspective had contributed to the sustaining concept of *Man the Hunter*. By observing the adaptive behavior of baboons in different contexts (for example, remote versus interaction with humans), Washburn saw that behavior reflected the perception and dynamics of group action. In this manner, it can easily be applied to the environmentally motivated behavior of, for example, the australopithecines. Working in unison, the behavior of these bipedal hominids must have been organized in a way for them to survive being surrounded by large carnivores. Reflective of baboon behavior and circumstance, the ratio between hominid to carnivore is not sufficient to support the commonly held belief that our ancestors were primarily scavengers.

Similar to the assessment of australopithecines, the abilities of Neandertals become a central point in question. Proceeding from the assumption that hominid taxonomy is beyond genetic analysis, Washburn's biological approach to anthropology

does possess some frailties; yet his understanding of anatomy's form and function allows for an interpretative stance. For example, although Neandertal's expressed behavior (art and burial) may be considered human, the degree of behavioral complexity (nonmaterial) becomes doubtful. This complexity is expressed in the nature of language. In Washburn's opinion, the complex features of language are essential to behavior. Because cranial capacity does not reflect intelligence, the language of the Neandertals was probably not comparable with modern *Homo sapiens*. At this point, the only indication of behavioral differences remains in the complexities of their respective material culture. Failure to deal with the fossil record appears to be the most problematic aspect of his anthropological approach. Although contributing to primatology and relating these factors to hominid evolution are astounding, the strength of his contributions involved his experiments within an anthropological and evolutionary framework.

Advancements from his experiments at both Columbia and Chicago, although controversial, remain to be scientifically valued. While at Columbia, Washburn's experiments revealed the influencing factors in the development of the mammalian skull. Washburn uncovered the influence of muscles and nerves on bone development: For example, premature closure of the sagittal suture in human beings results in a change in the length, breadth, and height of the cranium. In contrasting these experiments with his previous graduate research involving gibbons for Carpenter during the Shultz's Asiatic Primate Expedition, Washburn's interest in locomotion (bone, muscle, and joint operations) could be satisfied by his ability to dissect and study these primates. From these invaluable experiences, the relationship of muscles, cartilage, and bone become evident when comparing and contrasting our species and other primates within a functional framework (for example, hyoid bone in vocalization and muscles involved in facial expressions). At Chicago University, Washburn proceeded with experimentations to find out about skull growth. With two contending theories about growth, the first theory states that growth is at the sutures, and the second contends growth on the outside with inside absorption. Washburn's experimentations with pigs yield results that confirmed both processes are present. The results expressed that animals with thin skulls primarily developed at the sutures, whereas thick-skulled animals primarily developed on the outside with inside

absorption. This combination of processes can also be applied to the growth of brow ridges. If applied to different parts of the cranium (for example, nuchal crest), it becomes apparent how plastic and complex these features are in their composition.

Furthermore, Washburn used the same approach to the development and implementation of scientific evaluations for the emerging field of forensic anthropology. Being well versed in anatomy and biology, Washburn's keen eye for detail and understanding of population and gender differences resulted in the creation of ischio-pubic index for the determination of sex and race of skeletal remains. Utilizing these points of view, the emergence of a considerably enriched foundational perspective of forensic anthropology is unquestionable.

In the final analysis of his professional and academic contributions, Sherwood Washburn made great contributions to the field of anthropology. Scientific inquiry tempered with critical thought and a broad base of knowledge allowed for his greatest achievements. Anatomy, biology, and a sense of mechanical aptitude were the driving force behind his academics. Relating this information within an evolutionary perspective, Washburn's conception for anthropology brought a renewed direction and possibilities. Influencing the emerging fields of primatology, biological anthropology, and forensics, his methods, experiments, and theoretical foundation provided a solid foundation for the future of anthropology. As for the future generations of our species, and perhaps responding against views held by Hooton, Washburn held that education was the deciding factor to promote an equitable social system. He stressed the critical need for up-to-date material that complemented an involved teaching method that invoked personal meaning or purpose. Through this process of education, especially the teaching of evolutionary theory within an anthropological framework, future generations could both express our humanity and understand our species within a dynamic universe.

Washoe is a female chimpanzee (*Pan troglodytes troglodytes*) known for bringing insight into animal cognition, communication, and social complexity with her capacity for communicating via American Sign Language (ASL). Washoe was born in West Africa in 1965. It is suspected that she was taken to animal dealers after her mother was killed by hunters. Washoe was bought by the U.S. Air Force space program. Two University of Nevada scientists, Drs. Beatrix and Allen Gardner, visited the laboratory and recruited Washoe for their own research. The 10-month-old chimp was brought to the Gardner's Reno, Nevada, home and taught ASL. The Gardners named her Washoe Pan satyrus after Washoe County, Nevada. Washoe was cross-fostered in the Gardner home, living like a human child. She learned to eat with a fork, drink from a cup, dress herself, use a toilet, play with dolls, and look at picture books.

Washoe is credited with being the first nonhuman to acquire a human language. Using imitation, encouraged babbling, instrumental conditioning, and other techniques, Washoe began learning how to sign for basic objects such as food. After 51 months of training, Washoe had acquired approximately 132 ASL signs or "words." She used the signs for classes of referents, rather than simply for specific exemplars. For example, Washoe used the sign "open" to ask for various objects to be opened such as doors, cupboards, and jar lids. She also understood more signs than she produced or used.

In September 1967, a graduate research assistant, Roger Fouts, began working with Washoe. In 1970, the decision was made to send Washoe to the University of

Washoe

Source: Photograph courtesy of the Chimpanzee and Human Communication Institute.

Oklahoma with Fouts and his wife, Deborah. In 1980, they moved again, this time to Central Washington University (CWU) where Washoe joined the Chimpanzee and Human Communication Institute (CHCI). At CWU, Washoe became the matriarch of a small group of young chimpanzees who had also been cross-fostered and taught ASL. The chimpanzees in Washoe's new family included Moja, Tatu, and Dar. Loulis was a later addition and became Washoe's adopted son. Loulis was the only chimpanzee in Washoe's family that was not cross-fostered or taught ASL by humans. Instead, Loulis learned ASL from the other chimpanzees, especially Washoe. Washoe molded Loulis's hands into specific signs that Loulis eventually used himself. As an infant, Loulis acquired and used approximately 47 signs.

The researchers at CHCI have gathered evidence in support of the notion that chimpanzees have the capacity for human language. Notwithstanding, there have been numerous studies and publications on this controversial topic, with many researchers arguing that chimpanzees are incapable of human language. Regardless of these claims, research with Washoe continues. Currently, a staff of 45 graduate and undergraduate students, along with Roger and Deborah Fouts, are working to learn more about Washoe and

her family. Much of the data are taken from video recordings. All research conducted at the institute is at the will and interest of the chimpanzees. Studies are halted and sometimes cancelled all together if the chimpanzees do not want to participate.

WEGENER, ALFRED (1880–1930)

Alfred Lothar Wegener was born on the 1st of November 1880 in Berlin, and he died at the end of November 1930 in Greenland. His parents were preacher and orphanage director Dr. Richard Wegener and Anna Wegener, nee Schwarz. He was the youngest of their five children. In 1899, he took his school-leaving exam from the Köllnischen Gymnasium in

Berlin, and directly went on to University of Heidelberg to study the natural sciences, and in particular astronomy. Later he attended the Universities of Innsbruck and Berlin, and he successfully defended his doctoral thesis on November 24, 1904, at the University of Berlin (*magna cum laude*). For the following 2 years, like his brother Kurt, he was assistant at the Aeronautischen Observatorium Lindenberg. Together with his brother Kurt, he set the world record for the longest-lasting balloon trip in 1906. In the same year, he made acquaintance with the well-known meteorologist Wladimir Köppen. From 1906 to 1908, he took part in a Danish expedition to Greenland organized by Mylius-Erichsen. In 1909, he handed in a further thesis (*Habilitation*) at the University of Marburg, and became *Privatdozent* there, which implies the right to lecture (*venia legendi*) and can be compared to an associate professorship. From 1917 to 1919 he was a Professor in Marburg. In 1911, his well known book *Thermodynamik der Atmosphäre* appeared. On January 6, he gave his first presentation dealing with the continental drift theory at a meeting of the geological society in Frankfurt am Main. His complete theory concerning continental drift can be found in his most important book entitled *Die Entstehung der Kontinente und Ozeane*, which came out in 1915. From 1912 to 1913, he took part in another Danish Greenland expedition organized by J. P. Koch whereby they crossed the North of Greenland. After his return he married Wladimir Köppen's daughter, Else Köppen, who he met for the first time 5 years earlier when she was 16. He subsequently participated in World War I as a reserve officer (1914–1918). From 1919 to 1924 he was departmental manager of the German Seewarte in Hamburg, as a successor to his father-in-law, and also Professor at the University of Hamburg. Together with Wladimir Köppen, he published *Die Klimate der geologischen Vorzeit* in 1924, the year when he became a Professor of Geophysics and Meteorology at the University of Graz. He kept that Professorship until his early death in 1930. In 1926, a major symposium entitled "Theory of Continental Drift" took place in New York. Wegener himself did not participate in it, but contributed an article to the Conference Proceedings. In 1929, Alfred Wegener himself organized a preexpedition to the West of Greenland, to make some preparations and research for the main expedition the following year, which he planned, organized, and led himself. It was supposed to enable him to undertake his most important Polar research, but from the very beginning the expedition had to deal with many

unforeseen problems. During the expedition, in November 1930, Alfred Lothar Wegener died, most probably of a heart attack due to bodily overexertion.

Wegener's most important contribution to science was the development of the first complete theory of continental drift. In a letter to his future wife in 1910, Wegener wrote that he noted that the east coast of South America and the west coast of Africa look as if they used to be connected in earlier times, and that he wished to dedicate further thought to this idea. He did not refer to the shape of the contemporary coastlines but the margins of the precipice in the deep sea. An American study falsely claims that later researchers found this out. Wegener, of course, was not the first to note the similarity of the coastlines: Others had already noticed this a long time before the 20th century (for example, Francis Bacon and Alexander von Humboldt). However, Wegener was the first to put forward a complete hypothesis that dealt with the whole earth. In his most important book, *Die Entstehung der Kontinente und Ozeane*, he described in detail the hypothesis of the wandering mainlands, or the theory of continental drift. The other main theory concerning the history of the earth is that the mainlands have always been where they are now, only the flooding of some coastlines have brought about small temporary alterations.

Wegener based his theory on the following traditional understanding. Continents and the ocean floor consist of two types of earth's crust. Continents are based on lighter (*Sial*), the grounds of the oceans on heavier (*Sima*) stones—a distinction that is still valid today. Like ice floes, continents are supposed to swim on the heavier layers of Sima. As both Sial and Sima are solid bodies, a special explanation for the movement is needed. Wegener claimed that the following two forces are at work. First, the *flight from the poles* force explains the movement towards the equator, and second, the *tidal rubbing* would be responsible for the drifting to the west of the continents. However, Wegener also realized that these two forces are not sufficient. In the first edition of his book about the origin of the continents he mentioned that it is too early to try to answer this question, and in the fourth edition he admitted that the "Newton of the continental drift theory" has not arrived yet. In 1929, he briefly referred to convectional streams in the magmatic subsoil as a relevant force—this force is still regarded as the most efficient today.

After World War II in the United States, the theory of the plate tectonics became dominant. As this hypothesis is a type of continental drift theory, Wegener's research,

which was nearly forgotten by then, became central again. The research undertaken in that context confirmed many aspects of Wegener's theory. For example, both refer to a supercontinent (named Pangaea by Wegener) that was present in the Late Paleozoic era (about 250 million years ago), which first broke and then drifted apart. However, concerning the details the two theories also differ significantly. For instance, it is not the mainlands that wander, but rather the plates that enclose not only continents but also large parts of the sea.

WEIDENREICH, FRANZ (1873–1948)

German-Jewish physical anthropologist and anatomist Franz Weidenreich was known for his evaluation and interpretation of *Sinanthropus pekinensis*. Born in Endenkoben, Germany, Weidenreich developed an interest in skeletal structure and bipedal locomotion. Educated at several universities, Weidenreich received his MD from the University of Strasbourg (1899) and remained to teach anatomy. Shortly after graduation, he was appointed as an anatomy professor for the University of Heidelberg (1919). With developing interest in anthropology, Weidenreich left his position at Heidelberg for anthropology at the University of Frankfurt (1928–1933). Because of Germany's growing discontent toward citizens of Jewish descent, he left in 1934 for the United States. His association with the University of Chicago and the American Museum of Natural History would fall short of his accomplishments at the Peking Union Medical College.

As Director of the Cenozoic Laboratory of the Peking Union Medical College, Weidenreich continued the research on *Sinanthropus pekinensis* established by both previous directors Davidson Black and Pierre Teilhard de Chardin. The greatest contribution

was his detailed analysis of the fossil material recovered from the Western Hills of Zhoukoudian. Though the original fossils were missing, lost, or destroyed during World War II, Weidenreich's monographs (1936–1941) based on the evidence collected serve as a critical point in the process of reconstructing hominid phylogeny. Weidenreich continued to lecture and published articles and books based on his perspective. The most popular was his publication *Apes, Giants, and Man* (1946).

With each new hominid discovery, the exact relationship among these forms to the origin of *Homo sapiens* becomes a point of inquiry. In this intellectual spirit, Weidenreich addressed this perspective concern with *Sinanthropus*, *Pithecanthropus*, and Neandertal man, of which his terms Archanthropine and Paleoanthropine applies. According to Weidenreich, the hominid evidence must be considered holistically, regardless of time, extinction, or proximate distance. Morphological unity is a key concept. When considering these hominid forms, including their variations, there appears to be a gradual evolutionary line without any serious gaps or multilinear directions. This is due to the idea of the primitivity of traits. However, the key and essential traits that are considered primitive can be erroneous or misleading. Nevertheless, Weidenreich, as with Teilhard de Chardin, believed that the representatives of both *Sinanthropus* and *Pithecanthropus* (as reflected by the Neandertals) should be designated as *Homo* based upon these morphological similarities and burial habits. Because there is a fluid motion from one phase of human evolution to the next (discounting any sudden appearances), these phases in human evolution have experienced taxonomical extinction but continue to exist in their “extended” relatives.

In Weidenreich's publication *Apes, Giants, and Man* (1964), gradualism, as seen in Darwinian evolution, depicts this process of blending of physical characteristics (for example, phenotypic expressions). Hominid morphology indicates 10 evolutionary phases of Hominidae. Of these 10 phases, five phases are *Archanthropinae* (most primitive), three *Paleoanthropine*, and two *Neoanthropinae*. The *Archanthropinae* consists of *Gigantopithecus*, *Meganthropus*, *Pithecanthropus* (*erectus*, *robustus*, and *soloensis*), *Sinanthropus*, and *Java* forms found in East Asia. *Paleoanthropinae* are represented by Rhodesian man, Neandertalians, and Weimar-Ehringsdorf of Africa, Asia, and Europe. The last phase, the *Neoanthropinae*

phase, is found in the Pacific islands, Asia, Africa, and Europe. They are represented by various Wodjak group, Choukoutien group, Boskos, and Cro-Magnon groups; along with their modern groups of Australian, Mongoloid, African, and Eurasian, respectively. These three phases represents the descent of modern *Homo*. When these phases are contrasted with the four groups (horizontal differentiation)—for example, Australian, Mongoloid, African, and Eurasian—the evidence illustrates the incompleteness of the fossil record. This fact withstanding, the morphological evidence would suggest that each group evolved in different parts of the world or regionally and at different rates.

Although a gradualist perspective of evolution may not be a taxonomical issue, Weidenreich's interpretation of fossil evidence is a source of debate. As depicted in his phases of evolution, each hominid, though extinct, had its basis on the main stem of the phylogenetic tree. According to the available evidence, Weidenreich places both *Pithecanthropus* and *Sinanthropus* as the most primitive Neandertal group. From this stage, the next phase of human evolution is seen by *Homo solonesis*. This phase is directly descended from the previous *Pithecanthropus/Sinanthropus* phase. The remaining Neandertals represented by Spy and Ebringdorf specimens are an indication of variation. Proceeding from these phases, intermediary *Homo* and fossil *Homo* (represented by the Piltdown "specimen" prior to its exposure as a hoax) would lead directly, although regionally, to modern *Homo*. Based upon this view, Weidenreich stated that *Pithecanthropus erectus* should be called *Homo erectus javanensis*, *Sinanthropus pekinesis* should be called *Homo erectus pekinensis*, and *Homo soloensis* should be classified as *Homo Neandertalensis soloensis*.

The preceding interpretation of the evidence, for Weidenreich, allows for the transitional phase from Neandertals to modern *Homo* via regional evolution. Differing rates of evolution would allow for the conformity of the evidence. Even when considering the evolution of the human braincase, the known fossil stages all fall into the same pattern of expansion and direction. However, not all segments of Neandertal phase fit into this pattern, specifically the European Neandertals. The descent of modern Europeans from European Neandertals becomes highly questionable. Though not totally ruling regional descent improbable, evidence suggested that the latest stage of *Homo sapiens Europeans* probably developed in West or

central Asia and migrated to Europe during the last Glacial Period. For Weidenreich, the exact nature or fate of European Neandertals becomes moot. The variation seen within this regional scheme does not discount direct descent but allows for various *racial braches* of human evolution to develop. His depiction of the regional descent of *Pithecanthropus* to *Homo soloensis* to Cohuna Man and ending with Australian serves to illustrate such a view.

Though regionalism has gained acceptance, variable rates of evolution with racial connotations have severe philosophical implications. It would be certain that Weidenreich did not have this racial implication in mind when developing his theoretical framework. For Weidenreich, human variations, although based on a common ancestor, had developed under different environmental factors that influenced their respective development. From this categorization, it becomes possible that the term of "advanced" within a cultural context fosters the social construct that we deem as being race. *Race*, as a loaded term, is erroneous and misleading. Today, our species is held as one species with variations at the phenotypic level. Race is a social construct. This view withstanding, the contributions made by Weidenreich are substantial. His eye for detail and leadership had secured information concerning one part of human evolution that would have been lost. Weidenreich's unique interpretation of the evidence and reconstructing of hominid phylogeny gives anthropology one of many views concerning human origin. Although direct descent in regional evolution is problematic at best, including various independent forms of parallel evolution, Weidenreich's evaluation of the characteristics that are *Homo* serves as a point of critical reflection. It is his *spirit de corps* that allows the evidence to determine our defining quality: an evolving ontology without predestined teleology.

WELLS, H. G. (1866–1946)

Herbert George Wells was a novelist, prophet, and gadfly, one of the 20th-century's most multitalented thinkers. Born on September 21, 1866, in modest circumstances in Bromley, Kent, Wells narrowly avoided a life of penury and obscurity in the drapery trade his mother planned for him. He studied at the Normal School of Science at South Kensington (now the Royal College of Science and part of the University of London) under T. H. Huxley, and taught for a while, before being able to earn a living as a writer. His first published writing was a series of what were then known as scientific romances, now known as science fiction. The best of these works, *The Time Machine* (1895), *The Island of Dr Moreau* (1896), *The Invisible Man* (1897), and *The War of the Worlds* (1898) remain classics in their field to this day.

Common wisdom says that these works represent Wells at his best, but his writing career lasted another 45 years, and included some very significant books. After the scientific romances, Wells moved on to novels about life, the best of which were *Kipps* (1905), *Ann Veronica*, *Tono-Bungay* (both 1909), *The History of Mr. Polly* (1910), and *The New Machiavelli* (1911). These novels can be read as insightful stories about human interaction and for the specific insights into the mores of Edwardian England. Wells then moved on to what he later called his prig novels: *Marriage* (1912), *The Passionate Friends* (1913), and *The Wife of Sir Isaac Harman* (1913). Less successful as novels, these books revolved around ideas of social reform and personal commitment to living one's life fully and in the public interest.

As it did for most people of his generation, the onset of World War I produced a new range of conflicts that Wells felt the need to explore. While being suspicious of patriotism, Wells deeply loved England, and his wartime books, both fiction and nonfiction, reflected this tension. The best of his wartime works were *Mr. Britling Sees it Through* (1916) and *The Undying Fire* (1919). The war also brought on a short phase of quasimystical religiosity, expounded in *God the Invisible King* (1917), although Wells soon tired of that approach and returned to what he called in his autobiography “the sturdy atheism of my youth.”

After the war, Wells embarked on a series of what have been called textbooks for the world. They were the hugely popular *Outline of History* (1920), *The Science of Life* (1931), and *The Work, Wealth, and Happiness of Mankind* (1932). Each of these was very influential, despite a generally poor reception from the academic community. Wells hoped these books would become tools by which people took control of their destiny and worked cooperatively toward a new planetary humanism.

Largely in the service of this vision Wells produced a steady stream of novels. The most outstanding works from the interwar years were *Christina Alberta's Daughter* (1925), a study of the dangers of succumbing to transcendental fantasies; *Mr. Blettsworthy on Rampole Island* (1928), a black-humored dystopia about the breakdown of the Edwardian consensus about progress; and *The Bulpington of Blup* (1932), a comic look at human pretensions. *Mr. Blettsworthy*, in particular, deserves much more recognition than it has received, not least because it anticipated better-known dystopias like Aldous Huxley's *Brave New World* (1932).

Wells also became known in his capacity as a prophet of the modern age. He foresaw, for instance, trends such as the abolition of distance, nuclear war, suburbia, committed relationships outside marriage, even the Internet. He was also a strong proponent of the conservation of natural resources half a century before this became part of the cultural mainstream. Against this, as late as 1927, he was oddly unable to see much future for radio.

It is often claimed by Wells's detractors that he ended his days deeply disillusioned with the scientific rationalism he had spent his life advocating. His last work *Mind at the End of Its Tether* (1945) is usually cited in this respect. This claim, however, is unjustified, because Wells was never the uncritical rationalist his critics make him out to be. Since his earliest

scientific romances, Wells had been ambivalent about the power of science. Indeed, the strength of those works lies largely in his powerful articulation of this tension. Wells's career was an ongoing reflection about humankind's capacity to use responsibly the power that science was handing it. This underlies the lasting appeal of his science fiction, and reappears periodically, as in *Mr. Blettsworthy*. What the reader gets in *Mind at the End of Its Tether* is Wells's pessimistic and realistic strands interweaving with each other, with his more optimistic strand playing second fiddle.

There is another important sense in which the charge of Wells as a lapsed rationalist misses the point. Early in his career Wells was influenced by William James and later in his career by Friedrich Nietzsche, both stern critics of uncritical rationalism. Wells never arrived at a settled conclusion about Nietzsche. Earlier works like *A Modern Utopia* (1905) suggest the influence of Nietzschean ideas of the Overman. But these concepts were later jettisoned in favor of a cautious meliorism. The transition can be seen in Wells's 1938 novel *Star Begotten*, which discussed Nietzsche without arriving at any clear conclusion. And in his 1942 work *The Conquest of Time*, Wells spoke of the Afterman, a product of conscious renewal in the service of a nobler future for all.

Wells continued to produce engaging work until the last year of his life, highlights being *The Brothers* (1938), *The Outlook for Homo Sapiens* (1939), and *You Can't Be Too Careful* (1941), his last novel. During World War II, he was instrumental in composing a Universal Declaration of Human Rights, which exerted an influence on Eleanor Roosevelt's work to formulate the United Nations Declaration of Human Rights. Wells died on August 13, 1946.

WHITE, LESLIE A. (1900–1975)

Leslie White was an American cultural anthropologist known for his neo-evolutionary viewpoint. White was born in Salida, Colorado, on January 19, 1900 and planned a career in the natural sciences before joining the Navy during World War I. This experience had a profound effect on him shifting his interests from the natural to the social sciences. Following the war, he enrolled at Louisiana State University where he stayed for two years before transferring to Columbia University where he received a master's degree in psychology. White completed his doctorate at the University of Chicago under Edward Sapir and Fay Cooper-Cole.

White accepted an appointment at the University of Buffalo in 1927. Following a visit to a nearby Seneca Indian Reservation, White read Lewis Henry Morgan's *League of the Iroquois*. Morgan's evolutionary ideas resonated with White and he read the works of other evolutionary theorists including Herbert Spenser and Edward B. Tylor. White joined the faculty of the University of Michigan following the retirement of Julian Steward in 1930. Despite tensions with other faculty and administration, he stayed at Michigan until his retirement in 1970. During his tenure, the institution was transformed into one of the leading centers for anthropological teaching and research in the country.

White became a prolific writer while at Michigan, publishing *The Science of Culture* (1949), *The Evolution of Culture: The Development of Civilization to the Fall of Rome* (1959), and *The Concept of Culture* (1973). *The Science of Culture* is widely regarded as White's most important work and outlines his ideas about the relationship between culture, culturology (the scientific study of culture), and cultural evolution. According to White, the primary force in cultural evolution is technology and a culture advances as "the amount of energy harnessed per capita per year increases or as the efficiency or means of controlling energy is increased." As technology becomes more efficient (and more energy is harnessed), the social structure and ideological norms of the society change accordingly.

In addition to his writings on evolution, White continued his lifelong interest in Lewis Henry Morgan and wrote several volumes on Morgan's research and life. These include *Excerpts From the*

Source: Courtesy, Bentley Historical Library, University of Michigan.

European Travel Journal of Lewis H. Morgan (1937) and *Pioneers in American Anthropology: The Bandelier-Morgan Letters 1837–1883* (1940). He was also an avid field researcher who published several monographs including *The Acoma Indians* (1932), *The Pueblo of San Felipe* (1932), and *The Pueblo of Santa Ana, New Mexico* (1942).

White retired from the University of Michigan in 1970. Following his retirement, White moved to Santa Barbara and continued writing at the University of California. On March 31, 1975, he died of a heart attack. White will be remembered as a “neo-evolutionist” who reintroduced the concept of evolution into anthropological theory.

WHITE, TIMOTHY D.

Timothy D. White received his PhD from the University of Michigan and concerned himself with integrative biology, physical anthropology, and human evolutionary studies. He is a man who wears many hats: He has performed many important roles relating to his profession as a highly recognized anthropologist and has made significant contributions to hominid evolution. In addition, he is a professor at the renowned University of California at Berkeley, a curator for a museum, and a gifted researcher who is connected with the study of fossils relating to early primates. He is also associated with the Laboratory for Human Evolutionary Studies, which is an international center for research and training. It is thus quite understandable that his professional activities have brought him national and international recognition as a distinguished contributory scholar.

Dr. White is primarily interested in human evolution. He emphasizes fieldwork in his research and attempts to secure information about early hominid skeletal remains. For a long time Dr. White has pursued his quest for professional knowledge in East Africa, where he and his associates have analyzed early fossils for the valuable information that they can provide about our past. He has worked with a team conducting investigations relating to studies of his interest and their efforts have been quite successful.

White has made at least three important discoveries and findings: *Ardipithecus ramidus*, famous for its historical ancestry; *Australopithecus garhi*, where stone tools were found with the fossils; and at the end of the 1990s, Dr. White discovered three *Homo*

sapiens skulls. The discovery of the stone tools with *Australopithecus garhi* is valuable because it relates to the eating habits of early primates and may have affected their physical development. His research has also suggested that primates used tools more than 2 million years ago.

White's discoveries are important for a number of reasons but certainly because of what they have revealed about the early origins of mankind. Of course, they also have value in that they create interest in his subject matter for others and encourage scholars and research specialists to pursue additional study about the subject.

WHITEHEAD, ALFRED NORTH (1861–1947)

Alfred North Whitehead had a long and illustrious career spanning more than 60 years spread out over two centuries. Although Whitehead's contributions to anthropology are indirect and came principally toward the end of his life, his observations on the connections between nature and the human spirit were informed by a long lifetime of varied pursuits in fields ranging from mathematics to a sort of proto-theology. Whitehead's life is frequently broken down into three periods: Cambridge, London, and Harvard. It was during the Harvard period that Whitehead made contributions closest to the field of anthropology.

An Englishman by birth, Whitehead distinguished himself early in life as a mathematician of the first order. From 1885 to 1910, he taught at Trinity College in Cambridge, where he was the professor of a young Bertrand Russell. Russell would later go on to collaborate with Whitehead—as a colleague—on the monumental *Principia Mathematica*. While teaching in London from 1910 to 1924, Whitehead shifted the focus of his efforts somewhat to the more practical concerns of education, especially as they related to the working class. Even while fully occupied with teaching as various administrative duties, Whitehead managed to continue his impressive scholarly output, publishing three major treatises during this period.

Whitehead's Harvard period represented a sharp break from his past activities. Whitehead was 63 years old when, in 1924, he accepted a position as a professor of philosophy at Harvard University. In addition to leaving his native country for the United States, Whitehead was now entering into a field in which he had no formal training—philosophy. As one might expect, however, the general background that Whitehead had accumulated during what was already an extremely impressive academic and scholarly career, combined with his prodigious intellectual talents, made the transition a smooth one.

In 1925, Whitehead published *Science and the Modern World*, in which he advanced the thesis that philosophy was rightly regarded as “the critic of abstractions.” That is, philosophy should do more than merely remain comfortably ensconced in the realm of theory. As the critic of abstractions, philosophy must find a way to get beyond a worldview that assumes that the human mind cannot penetrate into the mysteries of nature as anything but an objective, dispassionate observer. While *Science and the Modern World* provides a schematic view of what such a philosophy might look like, it was in his magnum opus, *Process and Reality*, published in 1929, that Whitehead gave a full exposition of what would come to be called “process philosophy.” Whitehead himself referred to his system as the “philosophy of organism.”

Central to this system is Whitehead's notion of *actual occasion*. Whitehead describes an actual occasion as a process of becoming, as the coming together of the totality of a person's life experiences, particularly those in the recent past, which Whitehead refers to as *concrescence*. A human being is the totality of its experience, its concrescence. Whitehead's view thus resembles Sartre's concept of *facticity* (the sum total

of a person's experiences) and Heidegger's notion of *Dasein* (literally "being there" or, less literally, "human existence").

— Daniel Horace Fernald

WHORF, BENJAMIN LEE (1897–1941)

Benjamin Lee Whorf was a chemical engineer, a linguist, and an anthropologist. He pursued his interest in anthropology and linguistics as an avocation. While working as a fire prevention engineer (inspector), he developed an interest in linguistics, pursued in off hours and on business trips. Through his initial independent research and his later collaboration with well-known scholars such as Edward Sapir, Whorf made substantial and significant contributions to the fields of linguistics and anthropology.

Whorf's primary area of interest in linguistics was the study of Native American and Mesoamerican languages. In the late 1920s, Whorf began to correspond with noted scholars in anthropology, archaeology, and linguistics. In 1931, while still employed as a fire prevention engineer, he enrolled as a graduate student at Yale University in order to study under the noted anthropologist and linguist, Edward Sapir. While at Yale, Whorf began to study the Hopi language under the supervision of Sapir. Whorf and Sapir were interested in the relationship between language and human thinking, specifically how language can shape our thoughts.

Whorf developed a theory in collaboration with Sapir that became known as the Sapir-Whorf Hypothesis. It dealt primarily with the way that language affects thought. Whorf posited that the structure of a human being's language influences the manner in which a person understands reality and behaves with respect to it. Whorf held that "all observers are not led by the same physical evidence to the same picture of the universe, unless their linguistic backgrounds are

similar or in some way can be calibrated." Thus, for example, Whorf believed that speakers of Chinese dissect nature and the universe differently from Western speakers. Similarly, American Indians, Africans, and the speakers of many other languages would have a still different dissection of nature.

While at Yale, Whorf received many prestigious appointments in recognition of his important contributions to linguistics and anthropology. Yale appointed Whorf an Honorary Research Fellow in Anthropology in 1936, awarded him the Sterling Fellowship in 1937, and named him a Lecturer in Anthropology from 1937 to 1938. Although he did not pursue linguistics as a full-time profession, Whorf published his ideas on linguistics not only in major scholarly journals such as *Language* and the *American Anthropologist* but also in journals read by lay audiences. In forums such as MIT's *Technology Review* and *Main Currents in Modern Thought*, he wrote essays and reviews on a wide variety of topics.

Whorf's work did not become widely known in academic circles until the posthumous publication of his writings in the 1950s. In the 1960s, linguistic theories such as those proposed by Noam Chomsky focused on the universality of language and were therefore critical of Whorf's principle of linguistic relativity. However, advances in cognitive psychology and anthropological linguistics in the 1980s and 1990s created renewed interest in the ideas expressed in the Sapir-Whorf Hypothesis.

WILLIAMS, RAYMOND (1921–1988)

Raymond Williams was one of the foremost public intellectuals of the 20th century. As a social theorist

and cultural critic, he had a major influence on various fields, including anthropology, literary criticism, media studies, and history. Born into a working-class family in Wales, his academic career led him to Cambridge and Oxford. He was a driving force behind some of the major institutions of modern leftist scholarship, such as the *New Left Review* and the Birmingham Centre for Contemporary Cultural Studies. Like other neomarxist scholars, he was centrally concerned with the relationship between material and symbolic production, objective structures and subjective ideologies. Many of his books, such as *Culture and Society*, *The Long Revolution*, *Problems in Materialism and Culture*, and *Marxism and Literature*, share the common thread of interrogating the increasingly fuzzy boundary between the classical Marxist categories of “base” and “superstructure.”

Much of Williams’s work took as a starting point Gramsci’s seminal writings on hegemony. Williams viewed hegemony as a complex and contradictory process, rather than a uniform, static structure. He explored the limits and cracks in hegemony as well as its dominating power, and stressed that hegemony is never complete, but must constantly be defended and modified as it accommodates the perennial challenges to its encompassing authority. Still, evaluating the potential of such challenges for social transformation is no simple task. How may citizens distinguish between the alternative and the truly oppositional, the emergent counterhegemonic strains and the residual traces of prior social formations, given that countercultural forms and impulses are marginalized, selected, co-opted, incorporated, and even produced by hegemony itself?

Williams characterized his theoretical perspective as “cultural materialism” (not to be confused with the cultural materialism of Marvin Harris). In line with his view of culture as a productive process, he saw ideology as not only manifested in thought but also embodied in people’s lived experience. Similarly, he stressed the nature of language as material practice, the terrain on which formative social processes are played out. In this sense, language itself—including writing and other technologies of communication—is among the determining forces that drive social change.

In line with the historical significance he attributed to language, part of Williams’ contribution to social science were his genealogies of the “keywords” of Western thought, including that most fundamental to the discipline of anthropology: *culture*. By following

culture’s historical meanderings from the material, developmental implications of *cultivate* and *agriculture*, to the elite connotations of “high culture,” Williams illustrated the function of words as reference points for collective conceptions of society, and thus for the reproduction (and transformation) of social formations. He argued for a view of concepts not as static entities, but as problems, “historical movements that are still unresolved”—in which case we should not simply respond to their “sonorous summons,” but rather attempt to “recover the substance from which their forms were cast.”

Despite his own intense engagement with “high culture” (as theorist, critic, novelist, and playwright), his working-class origins were essential to his intellectual trajectory, and he was deeply engaged in British radical politics. Indeed, he strove in his writings and his actions to forge theoretical linkages between culture and politics, and to argue for the importance of the cultural realm in political activism.

WILSON, EDWARD O. (1929–)

Edward O. Wilson was born in Alabama on June 10, 1929. He grew up with an early interest in and utter fascination with the natural world. As he recalls, this enchantment began in the seventh year of his life when he spent the summer at Paradise Beach, near Pensacola, Florida. Wilson wandered the shores and tidal pools of the beach for hours on end, day after day, always in search of creatures to study and possibly capture. He was always searching for something more gigantic than his imagination could conceive. Ironically, a childhood accident left him blind in his right eye, which was an important point in his

decision to be a scientist and study tiny insects he could look at closely with his good eye: namely, ants.

Wilson is known by many titles, such as research scientist, environmental activist, ethical philosopher, and entomologist. He began his distinguished career by receiving his BS from the University of Alabama in 1949, and his MS in 1950 and his PhD in 1955 from Harvard University. He has spent much of his career as a professor at Harvard University and is presently a Pellegrino University research Professor and Honorary Curator of Entomology at Harvard's Museum of Comparative Zoology.

Wilson's early work focused on island biogeography. With R. H. MacArthur, Wilson published a theoretical explanation for the uneven distribution of species on islands. The basis of this theory depends on a balance between immigration of new species and the extinction of existing species. The main findings of this research that islands closer to the mainland will have increased biodiversity, as compared to islands at a greater distance, have become important to biodiversity conservation efforts. It has also been applied to management strategies for patchy ecosystems on mainlands that survive development but show a decrease in biodiversity.

Wilson is well known for his studies in entomology, especially myrmecology, the study of ants. He has made groundbreaking discoveries in regard to the biological basis of behavior in these social insects and applied them to the social behaviors of other animals. He was one of the first scientists to apply sociobiological theory to humans, positing that there are biological underpinnings to human behavior that have been selected for by evolution and are passed on through human genes. He even received the National Medal of Science in 1977 for his contributions.

Wilson's theories were heavily criticized and he was accused of subscribing to reductionism and genetic determinism. There is a well-known incident that occurred at the 1978 annual meeting of the American Association for the Advancement of Science. While Wilson was preparing to give a lecture, demonstrators charged him, poured a pitcher of ice water over his head, and said, "Wilson, you're all wet." Many people believe the idea that there is a genetic basis to human behavior to be morally reprehensible. It is often said that sociobiology is an excuse for the less desirable conditions, which humans impose on each other. However, it more obviously purports the understanding of such behaviors will more likely result in the ability to change them rather than perpetuate them.

Sociobiology's theories are now widely accepted as part of the biological and environmental explanations for the complexity of human behaviors, such as altruism or helping those who are not related with no apparent benefit to oneself. Wilson's 1975 publication *Sociobiology* has been widely accepted as one of the most important works dedicated to the study of animal behavior and has been instrumental to the evolution of the controversial theories of *Sociobiology* as applied to human behavior. Today, the discipline of sociobiology has developed into Evolutionary Psychology.

Wilson is known as "the father of biodiversity" and has spent much of the latter part of his career bringing the importance of every living species to the forefront of public attention with his presentations and publications. He is acutely aware of the detrimental effects of human habitation of the earth and as an active environmentalist. As a gifted writer, Wilson has published several books tolling the benefits of conservation and stewardship of the earth's natural resources. He dedicates much of his efforts toward enlightening others on the benefits of biodiversity and the reality that many species of plants and animals are going extinct every day.

Wilson believes that one of the main issues humanity must conquer is to raise the standard of living for the poorer countries of the world while doing as little damage to the surrounding environments as possible. By 2100, Wilson believes human impact on the natural world will be less extreme because population growth will subside. However, there is also the "bottleneck" effect of population growth accompanied by dwindling resources, which must be overcome. Essentially, the human population must pass through a time of turmoil before being able to see the benefit of conserving what is left.

Wilson is optimistic that this is possible. He believes the world will understand the benefits of biodiversity before it is too late. He likes to state statistics based on the amount of "free" resource services used by humans. He also advocates the preservation of biodiversity based on the fact that new plants and animals are still being discovered, some of which are found to have naturally occurring chemical and genetic compounds that may be helpful to humans through medical and agricultural innovation. Wilson states that it is in the interest of our own species' survival to preserve the life and habitat of all others.

Wilson serves on the Board of Directors of Conservation International, the American Museum of Natural History, and The Nature Conservancy. Wilson has received many awards and honors for his work including Pulitzer Prizes in 1978 and 1990, the International Prize of Biology from Japan in 1993 and The National Audubon Society's Audubon Medal in 1995. In 1998, Wilson gave a presentation to the U.S. Senate to support the Act to Save America's Forest, which is a bill that would conserve the biodiversity of the federal forest system and purports the inherent importance of all living things. His profound conservation ethic is delivered in a philosophical and scientific approach that engages his readers and lecture audiences. He has an infallible belief in the connection between humanity and nature, which has permeated his work for more than four decades and continues to influence young scientists and naturalists across the globe. His obviously emotional pleas for conservation have been heralded as a scientifically fueled and truly sincere approach to the preservation of the natural world.

WISSLER, CLARK (1870–1947)

Clark Wissler was an influential American anthropologist, although his impact on anthropological theory is often overlooked. Many of Wissler's ideas on culture area, culture pattern, universal culture pattern, and age and area distribution of cultural traits are still in use by anthropologists today. However, Wissler is rarely cited for his contributions to these theories. While Wissler is often dismissed as one of Franz Boas's less famous students, he only took a few classes

from Boas. His advisor was James McKeen Cattell, a psychologist, and Wissler actively promoted ideas that contradicted Boas's approach. Therefore, he was not in Boas's circle of students.

Wissler is particularly notable for being the first American anthropologist to address the issue of defining *culture*. He pointed out some aspects of culture that are today viewed as basic to understanding the concept of culture, including the idea that culture includes that which is learned, such as norms and ideas.

One of Wissler's most influential theories was his development of the culture area approach. Although this approach existed to some extent before Wissler, he was the first to apply it to research on Native American communities, thereby turning it into a practical and applicable theoretical approach to comparing different cultures and examining culture change. Wissler's culture area concept was that cultures could be grouped on the basis of the degree to which they shared cultural traits. Wissler's other theories include the *age-area hypothesis*, which is the term Wissler uses to explain his belief that cultural traits could be dated based on their distribution. Wissler also developed ideas on the spread of culture as well as the inherent nature of culture in all humans.

Wissler's legacy to anthropology is debatable. Some anthropologists believe Wissler's theoretical achievements in anthropology have been highly influential and unfairly overlooked, while others argue that Wissler's research had a racist nature, citing as evidence his book *Man and Culture* (1923). They believe that this explains his lower level of status within the discipline today.

Wissler was schooled in psychology, having earned his bachelor's and master's degrees at Indiana University in 1897 and 1899, respectively. He continued his studies in psychology, earning a PhD at Columbia University in 1901. While Wissler was working on his master's degree, he also taught psychology at Ohio State University. In 1902, he was hired as an assistant in ethnology at the American Museum of Natural History before taking over for Boas as curator. Wissler remained in his position as curator of the Department of Anthropology until 1942. At the same time, he taught anthropology part-time at Columbia University (1903–1909). Upon leaving his position at the museum, Wissler went to Yale University, where he worked in psychological research from 1924–1931 before becoming an anthropology professor from 1931–1940.

During Wissler's time at the museum, he led and directed numerous studies on Native Americans. Wissler published numerous books and articles on his research. He is credited with making the Northern Plains one of the most well known areas in ethnographic research at the time. He is also notable for developing the collections of the American Museum of Natural History.

WITCH DOCTOR

Witch doctor, also sometimes *witchman*, is an unfortunate term created by English speakers during colonial times in Africa to refer originally to healers using supernatural means, but it became a generic term for any sort of traditional healer anywhere, regardless of what methods were employed or what affliction was treated. It reflects a time when the label *witchcraft* was applied pejoratively to any supernatural practice or belief system that appeared radically different from the observer's custom, in spite of efforts by anthropologists to specify meanings. Early 20th-century anthropologists used the label witch doctor for specialists who treated victims of witchcraft, or who sought to cleanse alleged witches of their unwanted powers, especially when the healer used methods similar to those ascribed to witches. An early and influential usage of the term was by E. E. Evans-Pritchard in his classic 1937 work on Zande witchcraft, wherein he defines witch doctors as "diviners who are believed to diagnose and combat witchcraft in virtue of medicines which they have eaten, by certain dances, and by leechcraft" (this latter term is an archaic English synonym for medical healing, from the era when physicians employed bloodletting; its use by colonial-era anthropologists continued because healing methods

worldwide often include sucking an offensive substance from the body of the patient). Some scholars attempted to justify the term by showing that the specialist may be well-trained, insightful, and effective, like Michael Gelfand's sympathetic 1965 study of the Shona *nganga*. In 1978, George Foster and Barbara Anderson, in their book about "the new field of medical anthropology," distinguished between "the shaman with his direct contact with the spirit world, and the witch doctor (to use an outmoded but still useful term from the African literature) with his magical powers." But all such usages of the label are inadequate because they confuse witchcraft, sorcery, magic, spirit invocation, shamanism, and other beliefs and practices, and thus give no precise meaning to the term.

A great variety of traditional practices have been variously designated by the label witch doctor. Some referents and synonyms are medicine man (or woman), native doctor, diviner, prophet, shaman, healer, curer, spiritualist, herbalist, exorcist, and others. The label used may denote a general category of specialist (e.g., healer), or it may be a role term, indicating the dominant method employed by the specialist (for example, diviner, exorcist, or herbalist). Priests and shamans are highly trained specialists, distinguished by different techniques and different sociocultural contexts, but both perform a number of situational roles, in any of which the label witch doctor might be applied. Traditional healers typically draw from a wide stock of spiritual, mystical, material, and psychological methods, and may combine several in a specific treatment.

The witchcraft Evans-Pritchard referred to is a specific phenomenon found around the world in settled societies: It is an invisible evil power that vests itself in certain people, and thence moves freely among the "bush" and the world of spirits and its human host. It works in mystical ways. The power enables its bearer to leave his or her body, change form, fly, and work directly upon its target, and this can be done without magic or spiritual assistance. Wherever the belief exists, there will be specialists who combat it, and many of them, too, work in mystical ways. In many parts of Africa the witch doctor works through specially developed sensory perception; he may be called a "smeller" of witches, using the native term that means both olfactory and extrasensory perception. Among the Bachama of Nigeria witches are located and engaged in battle by a special fraternity of

men who have demonstrated an ability to “see” into the spirit world; their “sight” works through invisible apertures at the center of the forehead and the occiput.

Regarding medicine men, it should be understood that *medicine* is an English term expropriated in colonial times to refer to any substance or technique, including ritual, that has power to change the state of someone or to protect people against outside influence, acting as an amulet. It may be specified as “good” or “bad” medicine. Sometimes we may encounter the English word “poison” referring to such means used with negative intent. And so *medicine man* is an imprecise and not very useful label.

A job of the specialist healer, which might give him the title witch doctor, is to counter sorcery. Sorcery generally means one of two individual acts of antisocial manipulation of the supernatural: spirit invocation and command, or harmful magic. The specialist healer might invoke a benevolent spirit and send it to do battle with the evil one sent by the sorcerer, a method employed in South and Southeast Asia; or he might work countermagic, aiming to deflect or nullify the magic the sorcerer has employed, and protect his client with amulets. Just as sorcery “works” through the victim’s psychology—the best example being the “Voodoo Death” syndrome described by Walter Cannon in 1942—the antisorcery of the witch doctor works by convincing the patient that the evil influence is gone. As Cannon and others reported, relief may be rapid and dramatic. Both sorcery-induced illness and magical relief work through the same physiological mechanisms as operate in the placebo effect.

A shaman is a unique specialist, well described by anthropologists, found typically in small-scale mobile societies of Asia and early Europe and throughout the Americas. The English word derives from a term in the language of the Evenk, a Siberian Tungus-speaking tribe; it designates a status achieved after long study and apprenticeship, mastery of an altered state of consciousness called ecstasy, and successful completion of a period of deprivation and hardship resulting in profound personal transformation, the famous “vision quest.” The shaman is in charge of the social, spiritual, and physical health of his people; he is politician, psychological counselor, and religious leader, as well as curer of diseases. Many of his decisions are made after consulting with spirits through ecstasy. In this state the shaman’s soul leaves his body

and journeys to the realm of whatever spirit is sought for advice or bargaining regarding the human problem for which the shaman is seeking resolution. The shaman’s ecstatic state may be enhanced by ingestion of some psychotropic drug, and during his ecstatic flight, the shaman’s body may behave in bizarre ways—trembling, twitching, frothing at the mouth, and so forth; it may be these factors that attracted the label witch doctor. Today the label *shaman* has lost its original specificity and is applied popularly and by anthropologists to any religious specialist anywhere whose techniques include entering an altered state of consciousness.

Spirit possession is another type of altered state of consciousness employed by medical specialists, in which a spiritual entity enters a person’s body and takes control of it and all its faculties. Spirit mediums and cult priests may actively seek possession by particular spirits to acquire esoteric knowledge and guidance in curing human afflictions. Possession states commonly manifest in behavior alarming to Western observers, like convulsive jerking, frothing at the mouth, rolling back of the eyeballs, and glossolalia, all of which might justify the label witch doctor.

A patient’s ailment may be diagnosed as demonic possession, in which case the healer takes on the role of exorcist and employs any of a variety of means to lure or scare the possessing spirit out of the patient’s body. Many cultures distinguish between calm, orderly culture and wild, chaotic nature and believe that harmful possessing spirits are wild things of nature that can be successfully countered by invocation of even wilder and stronger things. The most effective remedies may include a variety of offensive materials and behaviors, such as fearsome masquerades embodying powerful nature spirits; magical enhancements of foul effluvia or body parts of dangerous animals; and techniques such as heating, chilling, beatings, or other inflictions of pain to render the patient’s body an uncomfortable abode for the possessing spirit. Any such methods might stimulate application of the pejorative label witch doctor.

Really, the label witch doctor combines implications of ignorance and backwardness. It is uninformative, and it should not be used by anthropologists or any serious students of culture.

—Phillips Stevens, Jr.

WITCHCRAFT

The term *witchcraft* is used in a great number of ways, to refer to supernatural beliefs and practices that the user considers evil or dangerous. Some of its many meanings are confusing, and its use is frequently pejorative, and unless it is carefully defined by its user it can be quite misleading. But it is the best term for a set of beliefs that ethnology has revealed to be nearly universal and that has great significance for anthropology and social psychology. So the student should take great care to understand exactly what the user means by the term, and to separate its many popular meanings from its anthropological ones.

Popularly, witchcraft can mean any of the many meanings of magic, most often with negative connotation (for example, “black magic”); or of sorcery; or specialized forms of divination, such as dowsing (“water witching”); or anything “occult.” It has been applied to any of the African-based syncretistic magical or spiritual beliefs found in the American South and the Caribbean, including individual beliefs and full-fledged religious systems, such as *mojo*, conjure, voodoo, *obeah*, *Vodou*, *Santería*, and so forth. It can refer to Wicca or other neo-pagan religious systems. It can mean satanism, or anything deemed satanic or inspired by Satan. It can mean romantic attraction, or irresistible fascination, or any power to confuse or make things appear differently, often as “witchery.” Often its use reveals more about the attitude of its user than its referent.

Among anthropologists, too, there is considerable variation in application of the term witchcraft. Some anthropologists in recent times have examined Wicca and other neo-pagan organizations, some of whose adherents refer to themselves as witches and their religion as witchcraft; but this is a recent phenomenon and belongs under the heading of alternative religions. It will not be discussed in this essay.

By witchcraft most anthropologists mean a set of beliefs in an evil power that vests itself in adult people and empowers them to do a variety of fantastic and terrible things. Unlike magic and sorcery, the power is not learned but innate, lodged within the body of the witch. Ethnology has found this belief system to operate in most of the world’s cultures and throughout recorded history. It reached its most elaborate manifestation in medieval Europe; but without its Christian trappings, the medieval European witch is nearly identical to witches of Africa, Asia, Oceania, and the Americas. There are variations on some of the features: For instance, the power may be sought, and acquired through specific means; or it may be inherited through family bloodlines; or it may develop spontaneously and work without its bearer’s knowledge. The power may be activated by negative emotion, or it may be always active, energized by its own evil. It is generally available to both men and women, although women predominate in witchcraft suspicions worldwide. The witch is such a bizarre conception that it took anthropology some time to recognize its distribution and its significance; once it did, ethnographic and explanatory studies increased exponentially, and today the anthropological and historical literature on witchcraft is enormous.

Witchcraft in Anthropology

The distinction between two types of human supernatural evil was recognized in the early 1900s, but elaborations on these two types, and recognition of their near-universality, developed later. Pioneering credit ought to go to Reo Fortune, whose 1932 study of male sorcery and female witchcraft beliefs on the Melanesian island of Dobu was the first detailed ethnographic account. But Fortune’s report of a society so rife with suspicion and mistrust that members fled to escape supernatural retribution was received by English audiences with skepticism, and it was not until three decades later that his conclusions were affirmed. In his foreword to Fortune’s book, Bronislaw Malinowski indicated the widespread fear of sorcery and witchcraft among the neighboring Trobriand and other islands, and said that he was then working on “the full account of Trobriand sorcery”; and we could imagine that he might have intervened and established for Melanesia a place as the type site for the anthropology of witchcraft studies. But Malinowski apparently did not finish that work,

and subsequent studies of these phenomena in the South Seas came much later. In 1935, the International African Institute's journal *Africa* published a special issue on witchcraft (Vol. 8, No. 4), with an introduction by Edward Evan Evans-Pritchard, and in 1937 Evans-Pritchard published his great work, *Witchcraft, Oracles, and Magic among the Azande*. The Zande case and "African witchcraft" became the standards by which subsequent studies were measured, and remain so today.

For the next two decades African witchcraft was a central focus of the structural-functional school of British anthropology. Some important representative works are collected in Max Marwick's *Witchcraft & Sorcery: Selected Readings* (1970, 1982) and John Middleton and E.H. Winter's *Witchcraft and Sorcery in East Africa* (1963). The war years obscured the important work of American anthropologist Clyde Kluckhohn, who recorded similar beliefs among the Navaho; an early edition of his *Navaho Witchcraft* was published by Harvard in 1944. But it was not until other studies appeared, like Jane Belo's *Bali: Rangda and Barong* (1949), Beatrice Whiting's *Paiute Sorcery* (1950), and Richard Lieban's *Cebuano Sorcery* (1967, Philippines), that it became clear that the distinctions between sorcery as learned technique and witchcraft as innate power were widespread, possibly universal. Striking similarities were seen between traditional ("primitive") witchcraft beliefs and those that characterized the terrible Christian witch-hunts of late medieval Europe. Several historians successfully applied anthropological perspectives to aspects of European witch beliefs.

Attributes of the Witch

Witches in each region have their own unique traits, but there are twelve attributes that characterize the witch wherever it appears. In this discussion it should be understood that *witch* refers to the power which may or may not be material, and which may work in the human world or in a separate, mystical dimension.

1. *Social subversion.* Witches are angry and spiteful and dedicated to the overthrow of orderly human society.
2. *Nocturnal activity.* Witches may operate in daytime, but they are most active at night.

3. *Transformation.* The witchcraft power can transform itself into the form of any animal, or bird, or another human form, or into invisibility.
4. *Flight.* The witch can fly, in the form of its bearer or an alter, and it can travel at great speed. The power can leave its human body behind as it goes off on its mission of mischief; or it can fly to another location in any form including the form of its bearer, so a person can be in two places at once.
5. *The familiar.* The witch may have a spirit or animal pet or companion that can share the power, and that can accompany the witch or be sent by the witch on its own evil errand.
6. *The "Sabbat."* Witches of a community meet together periodically, for an orgy of forbidden behavior, and to develop new strategies for social subversion. Because Jews were the first group to be collectively demonized as witches in Europe, the Hebrew word came to be used for the witches' gathering. The Sabbat is usually held at night at a known time and place, a wild dangerous place or a place of death, a cemetery or cremation site, a place people fear to go.
7. *Spread of disease.* Witches are universally blamed for epidemics, especially fatal diseases of unknown etiology.
8. *Abduction of children.* Witches everywhere are fond of little children, and seek to steal them (or their souls) away.
9. *Illicit sexual behavior.* Witches engage in whatever sexual behavior is considered abnormal and wrong by the society (e.g., incest, pedophilia, homosexuality, bestiality, public nudity, or bizarre sexual stimulations and positions). The agenda of the Sabbat often includes a sexual orgy, among the witches and with their human victims.
10. *Ritual murder.* At the Sabbat witches ritually kill their victims, usually with knives, and in very bloody fashion.
11. *Cannibalism and vampirism.* Witches eat the flesh and drink the blood of their human victims, either during personal attacks upon them in their homes, or after sexually and otherwise tormenting them at the Sabbat.
12. *Association with death.* Witches are always somehow associated with death, in at least four ways: they kill, they meet in a place of death, they use

corpses for food or for their terrible potions, and a myth of the origin of witches may say that the original power was first given to people in a Faustian bargain by a god of mortality.

Some variations on these attributes are widespread in specific regions. Christian conceptions of witches in medieval Europe had all 12 attributes; foremost among several specific details was that they were agents of Satan. Also, medieval European witches most often flew on some sorts of mounts, either fantastic creatures, male goats, or broomsticks. In sub-Saharan Africa, the witchcraft power is often located in a specific substance in the body; a fatty or tumor-like growth that can be discerned through autopsy; or animal teeth or a ball of metal or hair, or even a live snake, any of which had been swallowed by the witch, or developed mystically within its body. Also in sub-Saharan Africa witches walk upside down, a reflection of the general belief that witches embody the opposite of human norms. As elsewhere, the genitals are the locus of dangerous power, and social nudity is bad; African witches appear naked at the Sabbath. And when they fly, African witches often emit jets of fire from their anuses and armpits.

Similarity between certain attributes of witches and shamans in Asia and the Americas have been noted: transformation, flight, and working with familiars. The fact that shamans can work sorcery is not notable, as this is a learned skill open to anyone. But the combination of sorcery and witchcraft practiced by some shamans is unique. In his classic 1963 article “The Sorcerer and His Magic” (originally published in French, 1949), Claude Lévi-Strauss described how shamans could use their powers for evil purposes, in what later came to be known as “dark shamanism.” A collection of writings on this theme was compiled in 2004 by Neil Whitehead and Robin Wright in their book, *In Darkness and Secrecy: The Anthropology of Assault Sorcery and Witchcraft in Amazonia*.

Variants on the Theme: Were-Animals, and The Evil Eye

Belief in the ability of certain people to transform themselves into animals, also called *shape-shifting* and the animal counterpart a *were-animal* (from Old English *wer*, man), is widespread in world ethnology and may be a cultural universal. It is a defining feature

of witches and shamans, but it exists in other cultural contexts as well. Werewolves and vampires combine other features of the witch, specifically nocturnal behavior and desire for human flesh and blood, and they can be understood as regional variants on the witch–familiar theme.

The phenomenon known as Evil Eye is a clear variant on the witchcraft theme. This is a belief in an antisocial power that develops in some people, even without their knowledge. The power passes through the gaze, but it can just emanate from the bearer’s body. It is stimulated by envy or anger, but as it is an evil power it may act with no emotional trigger. Babies, sick, elderly, and otherwise frail people are most vulnerable; but, like witchcraft, Evil Eye can infect livestock, and can cause general misfortune. Perhaps everywhere people believe that evil can be transmitted through the eyes, but Evil Eye is an institution with specific characteristics and remedies, and can coexist with full-fledged witchcraft in some areas. It seems to have originated in the Middle East and is indigenous to the Mediterranean fringe, from whence it spread throughout Europe and across the Atlantic through European cultural influence.

Defense and Remedy

Defenses against the activities of witches are similar to those against demonic spirits and the mystical forces projected by sorcery. Magical power can be harnessed and manipulated, and powerful amulets are generally effective against all such evil influences. Representations of horns are widely used as anti-witchcraft devices; Italians wear little gold horns, *cornuti*, on necklaces, against the Evil Eye. In times of relative calm, witchcraft is stimulated by antisocial human emotions, envy, and anger, and so if witchcraft is diagnosed as the cause of some problem, people in some competitive relationship with the afflicted may be the first suspected. The most effective remedy is for the witch to confess and withdraw the spell. Most frequently the witch cannot be located, and a specialist, earlier termed a “witch doctor,” may be engaged to exorcise the witchcraft power and cleanse the afflicted persons and their surroundings.

Witches are a fact of social life, and it may be deemed necessary to conduct periodic anti-witchcraft rituals throughout a community. In some societies special organizations of psychically gifted people can sense the presence of witches or evil spirits through

some specially enhanced perceptual mechanism, such as attributed to the “witch smellers” of Central and East Africa. In the kingdom of Bachama of northeastern Nigeria, members of a secret society of men “see” witches through a conceptual organ at the forehead and the occiput. Identifying the witch is the most important step; driving it out with specially empowered spears or poisons is then easily accomplished. Or, powerful spirits may be invoked and embodied in fearsome witch-cleansing masquerades aimed at scaring witches away, such as the Nupe *ndako-gboya*, the Senufo *Kunugbaha*, and a variety of horned or tusked anti-evil masks, some of which breathe smoke and fire; or witches may be periodically propitiated, as in the Yoruba *Gẹlẹdẹ* or the Balinese *Rangda* masquerades. If a witch is detected, he or she may undergo a ritual of exorcism to remove the power from his or her body. In Africa this may require a spoken pronouncement and ritual spitting, or vomiting of the witchcraft substance, by the witch. Like sorcery, witchcraft “works” by means of the victim’s psychology, specifically the placebo effect, and culture-specific cures for witchcraft-inflicted diseases may have dramatic results.

Explanations

Through the 20th century the most common explanations for witchcraft beliefs, suspicions, and accusations were framed in terms of social and psychological functions. Like sorcery, witchcraft has been shown to serve various social control functions: lest they be suspected of witchcraft, people are careful to mind the norms of social propriety. Uncivil people, people who accrue extra wealth and do not share, people who avoid participation in social events, might be suspected. And, as Monica Wilson pointed out in her 1951 paper, “Witch Beliefs and Social Structure,” witchcraft provides a handy and logical explanation for social misfortune in cosmological systems in which chance and coincidence have no place. Witchcraft answers the questions, “Why me?” and “Why just then?”

A paradoxical fact of society is that social living generates tensions. In his appreciation of Evans-Pritchard’s great work in 1944, the British social anthropologist Max Gluckman famously said, “If a sociologist can find where charges of witchcraft in a particular society fall, he can almost reconstruct the social relationships of the society.” Social analysts

have shown that regular patterns of witchcraft (or sorcery) suspicion and accusation can be demarcated, according to the nature of social relationships. Relationships characterized by tension or competition are most likely to generate suspicion. Respect for the magical and social power of speech tends to deter suspicions from being verbalized in open accusation until there is credible evidence. It has been shown also that suspicions increase during times of stress; and as stress increases, accusations also increase, as less evidence is required for credibility, and the classic scapegoating function of witchcraft is demonstrated. The prevalence of witchcraft suspicions is a barometer of social stress; Max Marwick called it a “social strain-gauge.”

If stress remains high and some general sense of deprivation becomes prevalent, a group of people within the society might be blamed; they might be demonized in various ways, and a witch-hunt might be launched against them. The witch-hunt is a specific type of social persecutory movement. Its instigations and expectations, even its means, are like a revitalization movement turned inward. It might be temporarily cathartic for the perpetrators, proving a distraction; but its results can be socially devastating.

In a 1989 paper, James Brain noted that witchcraft beliefs are absent or unimportant, and sorcery beliefs weak, in small-scale, mobile societies with egalitarian values and little material property, like hunter-gatherers and pastoralists. By contrast, among sedentary indigenous peoples witchcraft beliefs are likely to be strong. Social fission is an inherent quality of nomadic societies, explained as a response to limited resources; Brain suggests that through the same mechanisms people escape the kinds of social tensions that generate witchcraft suspicions.

It should also be noted that among some reconstituted societies with syncretistic cultural systems, sorcery is present but witches are likely to be absent or only vestigial. Among African-based cultures in the Caribbean and South America, numerous African cultural elements are easily discernible, but the witch is notably absent. The social fears that find their focus in the witch are present, but are dispersed among other dangerous denizens of the night. There are shape-shifters; child-stealing, cannibalistic, and blood-sucking creatures; and a variety of mysterious sinister societies that meet in forbidding places at night; but there is no single creature that embodies all of the twelve attributes of the ethnological or historical witch. A possible explanation lies in another possibly

unique aspect of African witchcraft: It may be a marker of social membership. Each culture has its own form of witchcraft, which runs in the veins or is passed on among its own members exclusively. Among Bachama, for example, the witchcraft power is *mwito*. A person with long continuous ancestral links in the patrilineage is said to be *ji-bato ka mwito*, of the patrilineage with the potential for witchcraft; a person who traces his ancestry to someone who was adopted into the patrilineage is *ji-bato a mwito*, of the patrilineage but without the unique Bachama marker, hence possibly ineligible for inheritance of some important title. It may be that the unique blood-borne social marker was lost in the horrendous social devastation of the slave trade, and no acceptable substitute was possible in the construction of new organized societies in the New World.

Explanations for some witch fears have been found in neurobiology. An unusually terrifying nightmare, of the sort called a “night terror,” accompanied by sleep paralysis, might explain widespread reports of nocturnal attacks by witches and vampires who intrude into the bedroom and bear down on the terrified but paralyzed victim. The sufferer feels enervated and drained in the morning, which strengthens his conviction that some of his life force has been removed.

Explanations in terms of social and psychological function are situational; they may not indicate origin. The relatively new field of evolutionary psychology proposes that some behaviors and beliefs might be shaped by evolutionary biology, and is thereby rephrasing some explanations that anthropology has suggested for a long time. Today the highly productive brain sciences may confirm some such suggestions about the attributes of the witch, enumerated above. Some of these reflect universal cultural traits, and some can be seen as having adaptive value. Mary Douglas described witchcraft as “the standardized nightmare of a group,” and indeed, some of the twelve attributes of the witch embody deep human fears. Some seem clear: Attribute (1), social subversion, is the universal suspicion that generates conspiracy theories and witch hunts. It derives from the we–other social attitude that characterizes all coherent societies, and attribute (6), the secret gathering, is related. Attribute (2), fear of the night, is universal, and sensible. Attribute (8), abduction of children, reflects the universal instinctual reaction of alarm that all adults exhibit at the threat of harm to children. Attribute (9), sexuality, is central to the condition of being

human, and a central social issue in all cultures. Issues of deviant sexuality arouse visceral reaction in people. Attribute (11), cannibalism and vampirism, is universally deeply repugnant. Attribute (12), the awareness of death, is central to the human condition; it is a basic concern of all religions, and the fact of death is elaborately accommodated in all societies. Some of the other attributes are not so clearly fundamental to humanity, but they are suggestive: (3) and (4), the ideas of transformation and flight, characterize children’s fantasies and adult myths everywhere, and are the stuff of dreams; (5), the familiar, may be a projection of people’s universal relationships with animal pets; (7), epidemics, are socially and psychologically devastating, and are threats to the continuance of society; and (10), the universal civil sanction against murder, is clearly socially adaptive, and the idea of ritual murder is obscene sacrilege of the sort that generates rage in people.

Suggestions that these components of witch beliefs are rooted in fundamental human fears are strengthened by the fact that many of them are the stuff of conspiracy theories that emerge throughout history, allegations of the “blood libel” and other unthinkable terrible deeds made by one group against another; and most of them can be discerned in the fears of bloodthirsty satanic cults that swept Christian areas of the entire world in the 1980s and early 1990s, and still crop up occasionally. The satanists were alleged to do everything witches do, with three general exceptions: transformation, sharing of their power with familiars, and flight; but warnings from some fundamentalist Christian organizations did allege that Satan had empowered his servants with specific personal demonic spirits.

Witchcraft Today

It would be expected that as the education, religion, and technology of industrial societies permeate the traditional world, witchcraft beliefs would die. But for several apparent reasons witchcraft and related beliefs have continued in the modern world. One reason is that the agents of change rarely addressed traditional witchcraft beliefs specifically, simply assuming that their inherent falsity would become clear in modernization; another is that witchcraft answers questions that the new cosmologies, which accept chance and coincidence, cannot answer; another set of reasons is found in the visceral, instinctive fears expressed in

witchcraft's composite attributes, which are triggered into unthinking social action in situations of extreme anxiety (i.e., the witch may be a natural human phenomenon).

And, modernization is not systemic: It affects only parts of cultural systems, leaving the others to react. Corrupt governments, civil wars, ecological change, and epidemic disease have exacerbated poverty in Third World areas. Rapid globalization presents confounding new mysteries to people, rural and urban, bringing strange new values and drastically altering traditional social systems. Financial dealings via the Internet result in rapid and inexplicable wealth for some, and new ventures and risks for many. Witchcraft provides explanations that people can understand. In their 1998 Max Gluckman Memorial Lecture (published in the *American Ethnologist*, 1999), Jean and John Comaroff described new urban realities surrounding "occult economies" in South Africa. These beliefs, actually resurrections of old ones, include invisible hordes of zombie laborers, and a brisk and lucrative trade in specific human body parts, sought for their magical power and supplied by ritual murders, commonplace in the anonymous squalor of cities. Fears of various spells of sexual impotency, including "penis-snatching," have affected men in several West African cities in recent decades.

It is axiomatic in anthropology that witches become more important in situations of rapid social change. Traditional witchcraft beliefs have been expressed in murderous regional witch-hunts in South Africa and Indonesia, and local ones in South America and areas of the former Soviet Union, all in the decade of the 1990s. New expressions of the old beliefs have pervaded traditional areas today, stimulated by unprecedented social problems. Urban homelessness is now common, but is a relatively new phenomenon in African cities, and homeless people are frequently the targets of witch-hunting mobs. Hard economic realities have shrunk kinship systems in modern times, and today brutal armed conflicts and AIDS have killed enormous numbers of adults in Africa. A result is an unsettling new social phenomenon: orphans. Traditionally only adults could be witches, and children were the favorite victims of witches. But today some new and terrible realities of childhood, including abduction for slavery, involving both hard labor and sexual slavery, and for conscription into rebel armies as child-soldiers, and the formation of gangs of homeless urban street children,

have all contributed to the emergence of disturbing new beliefs in child-witches.

We might be reminded of the famous statement by George Lyman Kittredge, in his great work, *Witchcraft in Old and New England* (1929): "The belief in witchcraft is the common heritage of humanity. It is not chargeable to any particular time, or race, or form of religion."

WOLF, ERIC ROBERT (1923–1999)

Eric Robert Wolf spent his professional career defining and expanding issues such as peasant society, state formation, development of capitalism, and colonial expansion. He worked extensively to unite political anthropology, economic anthropology, and historical

sociology. He worked with the Marxist concept of *modes of production* as a conceptual tool in studying the historical and materialist consideration of a people in the cultural and ecological adaptations to a changing environment. Modes of production were looked at in a cultural ecological setting, and as a specific adaptation to a particular social and physical environment. Interconnecting relations with other cultures in different environmental settings was a modification of this adaptation. Particularly important to Eric Wolf was the interconnection between Europe and the rest of the world after the late 1400s. In anthropology, current ethnic history is the histories of peoples already impacted by European society, even if indirectly.

Through comparative studies, Wolf examined peoples of Latin America and the Caribbean that combined Marx's concept of modes of production with Julian Steward's cultural ecological adaptations. This developed a working model of world markets and imperialism with a history of colonialism and United States economic domination of the region.

Wolf helped define peasant societies by comparing them to both business farms and tribal production. A peasant farm is defined as a subsistence-based rural household economy. The surplus of a peasant farm supports a nonproducing elite. In his *Peasant Wars of the Twentieth Century*, Wolf outlined the central role played by middle-size peasant families in these struggles.

Eric Robert Wolf, in *Europe and the People Without History*, classified historical cultures into three basic modes of production: kin-ordered, tributary, and capitalist. Kin-ordered relates band and tribal societies or stateless societies. In tributary modes of production, the direct producers possess the means of production. The elite expropriates the surplus product by political or other types of noneconomic means. All precapitalist states were tributary. Asiatic is an example of a strong (centralized) tributary state, whereas feudal is a weaker one (decentralized); these two replace one another over time. Europe, from the 16th through the 18th centuries, was not capitalist, but a mercantile tributary (centralized) state. Capitalism emerged in England in the late 18th century. The capitalists enlisted labor under capitalism through the buying of labor power by the capitalists, leaving the workers with nothing left to sell but this labor power. Liberal political revolution, the industrial revolution, and free trade came together in England in part because of

its unique history and its geography so that it became the homeland of capitalism and divided the world into sections to meet the interests of the British capitalist.

In *Envisioning Power: Ideologies of Dominance and Crisis*, Eric Wolf investigated the history of ideas, power, and culture and how they interact. Wolf argues that power is important in shaping cultural evolution. Ideology incorporates power but ideas reflect cultural input. Belief about power and actual power converge through culture. Societies face tensions posed by ecological, social, political, economic, or emotional crises, and they utilize conceptual answers that use commonly unique, historically rooted, cultural understandings. In case studies of the Kwakiutl Indians of the Northwest Pacific Coast, the Aztecs of pre-Hispanic Mexico, and National Socialist Germany, Wolf analyzes how the ruling ideology, together with power, sanction the significant relationships that govern social labor.

WOLFIAN PERSPECTIVE IN CULTURAL ANTHROPOLOGY

Eric Wolf viewed culture as a web of relations, constantly changing over time. Power on the endpoints of the relationships is unequal, so that European merchants, for example, altered political arrangements in West Africa by trading guns for slaves, but relationships are mutually causal, and change extends in both directions. Nor is this a matter of change being imposed by the West on previously ahistorical cultures; there are

no ahistorical cultures, and the human world has always been a relational network, although there have been moments of dramatic change, such as the expansion of European capitalism after 1400. The method of anthropology, then, has to take this into account: Although ethnographic or archaeological research may be local in time and space, and sensitive to the richness and density of this immediate case, it should be mindful of wider connections and their dynamic, temporal character. Likewise even the “local” is constructed and reconstructed out of changing relationships over time.

Wolf’s approach represented a significant break with the main line of development of American cultural anthropology. Evolutionary theories of the 19th and 20th centuries, which influenced Wolf, largely addressed change over time as abstract recategorization from one stage to the next, rather than a mutual dynamic of differentiated but interconnected systems. Direct and indirect historical approaches had a place in anthropology, such as tracing of diffusion of culture traits across space (and putatively through time), but such work was consciously antiquarian and mostly ignored issues such as mercantile capitalism, migratory labor, European colonialism, missionization, and so forth. Instead, what was generally thought of as progress in social and cultural anthropology involved striving for the essence of an isolated culture, whether through culture and personality, functionalism, deep interpretation of meaning, ecological self-regulating systems, and so forth.

The contrast with these approaches helps us understand Wolf’s method. A mistaken impression is that he exclusively addressed the impact of European capitalism and colonialism on passive local populations. He did emphasize such issues to critique their neglect in anthropology. But his method, above all, sought connections and relationships, with a strong role for local processes in the broader world system. He began with a broadly Marxist approach to humans, emphasizing productive and reproductive activity within nature. Hence, there was always a component of ecological anthropology in his work, involving local environments though not envisioned as bounded or devoid of social relations of exchange and power (notably, Wolf helped begin the field of political ecology). Labor in nature was organized through social relations, which in turn required symbolic definition; thus, work and exchange of its products might be constructed around relations between

symbolically defined juniors and seniors, women and men, or lords and peasants. Again, there was considerable space for immediate personal relations and social structure, as well as much room for exploring key symbolic constellations. Finally, he conceived of such relationships as always involving unequal power, and he stressed attention to power in a discipline that often neglected its presence.

To understand core relationships, Wolf outlined three general modes of production, drawing on the Marxist tradition, but not in orthodox or scriptural fashion. The *kin-ordered mode* encompasses mobilization of labor and the distribution of its products based on ideas about kinds of and relations between people. The *tributary mode* involves political domination and surplus transfer from subordinates to superordinates based ultimately on force; it encompasses cases from fragmented feudalism to centralized pre-capitalist states. The *capitalist mode* of production emerges with the alienation of commodities from direct producers, including the creation of wage labor, the person as saleable commodity her- or himself. Although these modes take the form of a typology, Wolf was not interested in narrow questions of labeling or rigid definitions. Rather, he saw them as pointing to key vectors of reproduction and change in networks of relationships. He constantly strived to turn static systems into dynamic and contingent processes, so that social organization is actually “organizing” that is never complete, and symbolism is not just a meaning system in itself, but constant communication (indeed, repetition) of meanings and codes through social relations.

Certain relations have unusual potentials for expansion and for overriding or orchestrating other relations, and Wolf was particularly interested in them. This is distinctive, for generally anthropologists have focused on marginal and subordinated cultural settings. Early in his career, he explored the formation of the nation as a complex, hierarchical process of key symbols and actors organizing diverse regional sets of relations. Much of his work was dedicated to exploring the enormously dynamic force of capitalism, which he considered as having both unifying and differentiating tendencies. His final work, in turn, explored ideologies produced by elites during periods of increasing crisis in their rule, finding in these situations clues to the relationship between explicit ideologies and their broader cultural ground. Because Wolf paid attention to those processes that strove toward dominance, he is often understood as ignoring resistance and agency, but it is

of course necessary to keep in mind dynamics in both directions, and his own ethnographic and case-study work was superior in this regard.

The intellectual scene of anthropology has changed considerably, in part because of Wolf's own challenge to it. There is now wide recognition that cultures do not form reified, integrated, and isolated wholes, that culture does not just "exist" but is produced within social relations, often involving power, and it is now fashionable for ethnographers to study processes that span multiple sites. However, it is worth considering the continued relevance of the Wolfian method in this supposedly postmodern period. There is often a sense that modernity or postmodernity alone has resulted in fluidity and contingency. But as Wolf's arguments make clear, this is a constant result of the relationality of human life, although we must concede that contemporary technologies have increased the speed of connecting processes. There is, on the other hand, a tendency to endlessly question essences and reifications, which at a certain point becomes altogether vaporous as well as archly intellectual. This neglects Wolf's point about the groundedness of prosaic material and symbolic activity in the world, for lived experience is often redundant and essentializing in an incomplete way.

This is not to say that Wolf's work is above critique. His focus on capitalism is justified, given its powerful causal drive, but there is a good case for addressing multiple systems of domination, such as gender and sexuality. His concept that all human relations involve power, while penetrating, puts an excessive emphasis on power alone and summons up a limited portrait of humanity (as do parallel arguments by French philosopher Michel Foucault); we need more space for phenomena such as integral work, creativity, release, and love. Wolf himself was a humanist and politically engaged anthropologist, but we need critical attention to the political-ethical implications of these theories of omnipresent power.

WOMEN AND ANTHROPOLOGY

In all four fields of anthropology (Cultural, Archaeology, Linguistics, and Physical Anthropology) women have made significant contributions to establishment and growth of the field. In addition to providing role models for future generations, the earliest women in the field pioneered pivotal studies, generating new questions and venues for research. The discussion of women in anthropology is closely intertwined with the development of the feminist movement, as it is with the debate on gender equity. Early pioneers set the stage for later developments. These women have constructed the heritage of anthropology and at the same time have become mentors and advocates for future women in the field.

Early Pioneers in Cultural and Linguistic Anthropology

A pioneer in American ethnology, Matilda Coxe Evans Stevenson (1849–1915) was the first woman to work in the American Southwest, focusing on the Zuni. A vocal advocate for women's professional equity in anthropology, Evans Stevenson also became a supporter for Native American reform. She and Alice Cunningham Fletcher (1838–1923), a fellow anthropologist who advocated for both Native American reform and education, lobbied Congress for protection of Native ruins. Although the bill failed, it is considered the prototype of the Lacey Act of 1906.

Continuing Evans Stevenson's work in the American Southwest was Elsie Clews Parsons (1874–1941), a

cultural anthropologist and folklorist, known for work among the Hopi and Pueblo tribes and early work in Black folklore. Parsons believed folklore was a key to understanding a culture, and that anthropology was a vehicle for social change. An outspoken feminist and social critic, Parsons has the distinction of being the first female president of the American Anthropological Association (1940).

Parsons was influential in promoting women in the field. She is known to have financed Gladys Amanda Reichard's (1893–1955) work on Navajo society. Reichard, a cultural and linguistic anthropologist, is the first woman to highlight the importance of women's roles and perspectives in gaining a complete understanding of any culture. One of Reichard's students, Eleanor Burke Leacock (1922–1987), became an important member of the second wave of feminism that developed in anthropology.

In 1921, Parsons encouraged her student (and friend), Ruth Fulton Benedict (1887–1949), to become an anthropologist. Benedict is widely known for her book *Patterns of Culture* (1934) in which she uses cultural relativism to understand behaviors said to appear in every human society. Parsons introduced Benedict to Franz Boas at Columbia University, where Benedict also met (and taught) Margaret Mead (1901–1979; discussed below), Vera Dourmashkin Rubin (1911–1985; founder of the Research Institute for the Study of Man), and Edward Sapir.

During her time at Columbia, Benedict worked with Ella Cara Deloria (1888–1971), who was also teaching there. Deloria was a Yankton Dakota, and was known for her linguistic and ethnographic work with the Sioux nations. During this time, there were many women working with Native American Tribes. Carobeth Tucker Laird (1895–1983), an American ethnographer and linguist known for her efforts to preserve Chemehuevi language and mythology provided the scholarship with some early work in this region. In addition to Laird, Frances Theresa Densmore (1867–1957) was a pioneer American ethnomusicologist known for her recordings and publications on North American Indian music. The ethnographic study of Native American textiles was conducted by Lila Morris O'Neale (1886–1948). One of the earliest medical anthropologists working with Native American patients was Dorothea Cross Leighton (1908–1989). Leighton argued that White physicians' ignorance of native culture had a negative impact on Native American patients. She has the distinction of being

the first president of the Society for Medical Anthropology.

Anthropologists working outside of the United States include women like Hortense Powdermaker (1896–1970), who had diverse and wide-ranged interest of research and is well known for her 1966 book, *Stranger and Friend: The Way of an Anthropologist*. Another key figure in early anthropology is Margaret Mead (1901–1979), who conducted research on child rearing and personality in Samoa, New Guinea, and Bali. In Bali she pioneered the use of photography for anthropological research, taking more than 30,000 photographs of the Balinese. A prolific writer, Mead wrote 44 books and more than 1,000 articles and also held prominent positions in various organizations and received numerous awards, including being one of the first female anthropologists elected to the National Academy of Sciences (Mead shared this honor with Frederica de Laguna, who is discussed below).

Early Black Pioneers in Cultural Anthropology

One of the first Black women in the field, Ellen Irene Diggs (1906–1998) conducted research focusing on African influences on Cuban culture. Another major figure in the history of African American women in anthropology is Vera Mae Green (1928–1982), a social and applied anthropologist known best for her study of family and ethnic relations in the Dutch Antilles and the United States. She served as director of the Mid-Atlantic Council for Latin American Studies, as convener of the Quaker Anthropologists, was active in the Society for Applied Anthropology, and as president of the Association of Black Anthropologists.

Early Pioneers in Archaeology and Physical Anthropology

In the subfields of archaeology and physical anthropology, early examples of pioneering women include Esther Boise Van Deman (1862–1937), an archaeologist working on Roman Architecture; and Margaret Alice Murray (1863–1963), a British scholar and specialist in Egyptian hieroglyphics who, in 1895, was the first woman permitted to conduct her own excavation at the Temple of the Goddess Mut at Karnak, Egypt.

Well-known specialist of the Near East, Gertrude Margaret Lowthian Bell (1868–1926), was a British archaeologist, writer, and government official. She traveled extensively and, from 1899 to 1914, made several archaeological expeditions in the Middle East, and published her photographs, sketches, and travel logs. A contemporary of Bell's, Harriet Boyd Hawes (1871–1945) was the first archeologist to discover and excavate a Minoan settlement on Crete.

Also working in the Old World was Gertrude Caton-Thomson (1888–1985). Caton-Thomson excavated extensively in the Old World. Caton-Thompson initiated a survey of the northern Fayum with geologist Elinor Gardner (b. 1892). Later, that same team, accompanied by Freya Stark (1893–1993), began the first systematic excavation in the Yemini Protectorate. As one of her last projects, Caton-Thompson excavated and directed stratigraphic studies of architectural remains in Zimbabwe.

It was under Caton-Thomson's direction in Zimbabwe that Kathleen Kenyon (1906–1978) first excavated. Kenyon had worked with Sir Mortimer Wheeler and through his training learned the importance of stratigraphic excavations. She first introduced this method of excavation in the Near East at the site of Samaria (1931–1933). Her focus on stratigraphy at Jericho made the site the example for the Kenyon-Wheeler method of excavation.

Archaeologists working in the Americas include women like Frederica Annis Lopez de Leo de Laguna (1906–2004), ethnologist and archaeologist, who is known for her pioneering work in Northwest North America in Alaskan prehistory. A contemporary of hers, Hannah Marie Wormington (1914–1997), was an American archaeologist noted for her study of Paleo-Indians in the Southwest. Wormington was the first female president of the Society for American Archaeology (1967).

Another first was Dorothy Annie Elizabeth Garrod (1892–1969), who was the first woman to do research in Paleolithic archeology and to study early humans. Through her research in the British Upper Paleolithic, she correlated faunal remains and climactic and ecological conditions of ancient times. Garrod was the first woman recipient of the Gold Medal of the Society of Antiquaries of London.

Mary Douglas Nicol Leakey (b. 1913), a British paleoanthropologist, is renowned for her discovery at Olduvai Gorge in 1959, where she discovered the 1,750,000-year-old skull of *Zinjanthropus* (later

reclassified *Australopithecus boisei*), which first showed the great antiquity of hominids in Africa. At Laetoli, Tanzania, she discovered the 3,750,000-year-old jaws and teeth of a *Homo* species (1975) and the 3,600,000-year-old fossilized footprints of a bipedal hominid (1979). Mary Leakey's second son's wife, Meave Leakey (b. 1942), continues in the tradition of the Leakey family's work in paleoanthropology. In 1995, she and her team described a new hominid species *Australopithecus anamensis*, and in 2001, another new species, *Kenyanthropus platyops*.

Three of the most famous primatologists, labeled "Leakey's Angels" (referring to Dr. Louis Leakey and his influence on their research) include: Dian Fossey (1932–1985), a noted primatologist who dedicated her life to studying and protecting the mountain gorillas in the Virunga Mountain region in Rwanda, Africa. The second, Biruté Mary F. Galdikas (b. 1946) devoted her life to the study of orangutans; and the third, Jane Goodall (b. 1934), has earned recognition for her work with chimpanzees. Each of these women not only contributed significantly to primatology, but also set up foundations for the continued study and protection of the wildlife of the regions they work in. Currently, work on baboons is conducted by Barbara B. Smuts and Shirley C. Strum, each working with baboon populations on male–female relationships, sex roles, and aggression.

Feminist Anthropology

The issue of women in anthropology was not one of empirical value, but rather of representation. Women were always discussed in ethnographic works, but the manner varied based on the author.

Feminist anthropology may be traced in three temporal movements. The first wave of feminism (1850–1920) refers to the inclusion of women's voices in ethnographies, and providing the female perspective on events. Key figures in this movement were Elsie Clews Parsons, Alice Fletcher, and Phyllis Kayberry. The second wave (1920–1980) focused on the separation of the concepts of sex and gender, sex being defined biologically, and gender, culturally. Margaret Mead was a key player in this wave, as well as Eleanor Leacock. By the 1970s, feminist scholars such as Lucy Slocum argued to deconstruct the androcentric and Eurocentric biases in anthropology, and were joined by other anthropologists like Michelle Rosaldo, Louise Lamphere, Gayle Rubin, and Sherry

Ortner, who continued to question the construction of gender in society. The third wave (1980–present) moved beyond the biological distinctions of sex to acknowledge the cultural variations on that concept as well. This brought forth topics such as reproduction and sexuality, queer studies, and gender and the state. Third-wave feminism emerged from a space within postmodernism that allowed for the recognition that not all women have the same universal needs; and issues of class, race, ethnicity, socioeconomic status, and so forth are also important characterizations for understanding humanity.

Gender Equity in Anthropology

Women in anthropology today continue to struggle to achieve equity, which include access to resources for research and publications, and equal opportunity for job candidacy. Groups such as the Council on the Status of Women in Anthropology (COSWA) monitor the status of women in the discipline by providing attention to sexual harassment, part-time employment, and issues of productivity assessment that are crucial for issues of promotion and tenure.

WOMEN'S STUDIES

Women's Studies examines the scholarship and theory on the history, status, contributions, and experiences of women in diverse cultural communities, and on the significance of gender as a social construct and as an analytical category. Women's Studies challenges the gendered knowledge base that was assumed to be universal. As an interdisciplinary course of study, Women's Studies encourages the appreciation and understanding of gender as the basis of social relations of power, individual and collective identity, and the fabric of meaning and value of society. It is a study that is academic and activist. The activism component of Women's Studies comes from its political roots in feminism, a product of late 1960s women's liberation movements called the *Second Wave*. Feminism refers to the commitment to actively engage in political and social change that promotes equality in all aspects of life for those who are historically subordinated and oppressed by gender, race, ethnicity, sexuality, religion, disability, or other differences. The term *feminism* originated in 19th-century France and combines the French word for woman, *femme*, with the suffix meaning political position, *ism*. According to feminist historians, the French used *feminism* as it referred to those who defended the cause of women. During the late 1960s and 1970s, women took up the expression as it was associated with the work of the French philosopher Simone De Beauvoir, whose classic work *The Second Sex* (1949) was one of the early texts that considered how women have been thought about, and how women can think about themselves. The word *gender* refers to the socially constructed set of attitudes and behaviors usually organized as masculine or feminine. On an international basis, the heightened awareness of gender as a social construction was a result of the many activities by governments and organizations during the United Nations Decade on Women (1975–1985) and the UN-sponsored Fourth World Conference on Women held in Beijing (2000). During Beijing Plus 5, thousands of women from across the globe conferred around issues of feminism, the state of material conditions of women and girls, and the growth of women's and gender studies. According to the National Council for Research on Women, there are more than 300 centers in 80 countries that focus on women's issues and gender equality, and many of those units are located

in universities. However, the majority of Women's Studies departments and programs in higher education are found in the United States. As a contributing field of inquiry to women's studies, feminist anthropology incorporates the perspectives of feminism in its contribution to the study of the meanings and relationships of gender across the subfields of the discipline, following and influencing the paradigmatic shifts in intellectual inquiry and directing social policy.

Second Wave Feminism

In the late 1960s and early 1970s, Women's Studies courses appeared in colleges across the United States, with the first academic units founded in 1974 at San Diego State University and University of Maryland. The groundswell of interest came from the social movements of the times—Women's Liberation, the Civil Rights Movement, Black Power, Native American and La Raza—Chicano—Latino movements, and the 1960s student unrest and protests against the United States' involvement in South East Asia. This time period marks the rise of what is called the Second Wave of feminism. Over time these forces of social change were joined by the activism on behalf of Asian Americans and gay, lesbian, transgender, and bisexual rights groups. At the very outset, however, Women's Studies contested the gendered system as institutionalized in places of higher learning, but also opposed the prevailing ideology of culture and society in which the dominant message was that the human experience equals male experience. One hundred years of struggle on behalf of women's rights and issues were necessary to the founding of Women's Studies as academic units in higher education.

In the United States, feminism as a form of activism on behalf of women's rights began in the mid-19th century with a women's rights convention held in 1848 at Seneca Falls, New York. Among the grievances identified at Seneca Falls were the equal treatment of women and men under the law and voting rights for women. These goals were fraught with racial and class contradictions, as proponents assumed that these objectives implied that only White, middle-class women could claim equality and enfranchisement. On another plane of existence and activism were the Black women who were part of the abolitionist movement. As Carla Peterson notes, these women traveled throughout the northern part of the

United States “insisting on their right to preach the gospel, to lecture, and to write on such topics as religious evangelisms, abolitionism, moral reform, temperance and women's rights.” Among this group were Maria Stewart, Jarena Lee, Mary Ann Shadd Cary, Frances Ellen Watkins Harper, and a former enslaved woman who took the name of Sojourner Truth. In her anti-slavery, pro-woman's speech during a Woman's Convention in Akron, Ohio, in 1851, Sojourner Truth used the legendary phrase “Ain't I a Woman?” in claiming her rights of emancipation and enfranchisement. Following the Civil War, Susan B. Anthony, Elizabeth Cady Stanton, and Lucy Stone, among others, focused on gaining voting rights for women and formed the National Woman Suffrage Association. In 1896, the National Association of Colored Women was formed, bringing together more than 100 Black women's clubs. Leaders in this group were Josephine St. Pierre Ruffin, Mary Church Terrell, Ida B. Wells-Barnett, and Anna Julia Cooper. As a unified force, the National Association of Colored Women agitated for equal rights and the vote for all women across the color line. Typical of the racial divisions of the society, even suffrage parades mirrored this situation, exemplified when Ida B. Wells-Barnett was not allowed to accompany the Illinois contingent but was instead delegated to march at the end of the entire procession. Nevertheless, it was not until 1919 that the federal suffrage amendment, originally written by Susan B. Anthony in 1850, passed both the House of Representatives and the Senate and was sent to the states for ratification. On August 26, 1920, the 19th Amendment to the United States Constitution, granting women the right to vote, became law. Historian Rosalyn Terborg-Penn looked at the ways that United States Commonwealth territories acted on the passage of the 19th Amendment. Among Puerto Rican women, women's suffrage was political leverage to fight economic oppression. Labor organizer Genera Pagen, a Puerto Rican and United States citizen, demanded the right to vote once the 19th Amendment had been ratified. As a New York resident, she could vote, but not as a woman on the island of Puerto Rico. Although the women's suffrage amendment passed in the Puerto Rican legislature in 1929, it enfranchised only literate women, the significant majority of whom were members of the White elite, leaving women of color to continue their suffrage struggle. In 1935, all women, regardless of race or literacy level, were enfranchised in the U.S. Virgin Islands.

During the 1930s, the Women's Bureau of the Department of Labor was formed to collect information about women in the workplace, and 10 years later the dissemination of contraceptive information through the mail is no longer classified as obscene. In 1935, Mary McLeod Bethune organized the National Council of Negro Women, a coalition of black women's groups that lobbied against job discrimination, racism, and sexism. There were still mixed messages about women and work. Throughout the Depression, a great deal of propaganda told women, meaning White women, that entering the workforce took jobs away from men. Men were the idealized breadwinners for households and families. During World War II, similar to efforts during World War I, women were implored to work in heavy industry and in other non-traditional areas of employment, a history that is documented in the film *The Life and Times of Rosie the Riveter*. In the postwar era, women were told that work away from the home was unfeminine and harmful to family life. These prescriptive measures only applied to middle-class White women. The poor and working class Whites, immigrants, and women of color could not often afford not to work outside of the home, as their income was a necessity for their own and their family's survival. Nonetheless, middle-class women disregarded the long-standing customs and steadily entered the workforce. It was not until 1961, during John F. Kennedy's presidency, that the federal government concerned itself with gender inequality, particularly in employment practices. A Presidential Commission documented the substantial discrimination against women in the workplace and made specific recommendations for improvement, including fair hiring practices, paid maternity leave, and affordable childcare. The disclosure of the levels of sexism within the society on institutional, social, and cultural levels in the 1960s through 1970s accelerated the Women's Liberation movement that eventually gave rise to the Second Wave of Feminism. This Second Wave took hold of the minds and politics of the people in the United States and elsewhere in the world. The establishment of Women's Studies as an academic and activist program was one feminist outcome that moved society toward embracing the ideal of gender equality.

In the first instance, Women's Studies challenged the content and form of education on all institutional levels, but particularly in higher education. It was not uncommon for girls to strive for traditional

occupations, such as teaching on a kindergarten–12 level, nursing, and secretarial work, whereas boys were encouraged to focus on areas in mathematics and the sciences. As Women's Studies scholars note, there was a tendency to reward girls who were compliant and passive rather than assertive and inquisitive. Furthermore, because it was men who historically exercised authority in educational institutions, especially in the postsecondary levels, they determined what were valid fields of inquiry and the legitimate methods of analysis and research. This was the situation that women scholars and activists faced in bringing the study of women into the academy. Theirs was a different agenda than the one in place. Not only were women's scholarly contributions placed at the center in the learning process, but also individual women's lives and experiences were made important aspects of this knowledge. The feminist slogan "The personal is political" was embedded in the educational process, as traditional domains of what was considered "female" and "male" were understood as a process of the gendered system that was socially constructed and institutionalized on the basis of the designated sex. Margaret Mead's (1935) study in New Guinea distinguished gender, womanhood, and manhood from sex as a biological concept. The gender of a member of a society had implications for the division of labor, including domestic labor, and the regulation of sexuality. Furthermore, the differential valuation of male over female, called sexism, was deemed "natural" at best, "God given" at worst. In the United States and many other cultures, patriarchy is the ideological political construct. This means men dominate women, thereby what is masculine is more highly valued than that associated with women. This ideology is the foundation of Western theories of thought and institutionalized in the three major religious practices of the world, Judaism, Christianity, and Islam. Furthermore, gender is at the heart of these socioreligious systems, feeding into issues of procreation, marriage, family, birth control, abortion, sexuality, homosexuality, and other main debates in Women's Studies.

As an interdisciplinary course of study, Women's Studies relies on the scholarship emanating from its own domain and that produced in other fields of inquiry. Equally influential were the political divisions within the Second Wave of the feminist movement. In the early years, scholars—particularly the critics of both the academic and political aspects of

the women's movement—viewed Women's Studies and feminism as a single, unified approach. This was never the case, as the plurality of feminisms is one of its discursive strengths. However, there were at least four political perspectives identified with Women's Studies and feminism during the 1960s and 1970s: They were liberal feminists, Marxist feminists, socialist feminists, and radical feminists. These strains of thought bridged the viewpoints coming from different contributing disciplines and political groups at the time. *Liberal feminism* viewed gender inequality as a form of discrimination. Many mainstream programs, including those aimed at ending sex discrimination in the workplace, took this position. For *Marxist feminists* gender inequality was rooted in hierarchy of social class. *Socialist feminists* noted that gender oppression cuts across social class boundaries. Finally, for *radical feminists*, gender inequality was rooted in the nature of traditional heterosexual interpersonal relationships in both the private and public sphere. Some radical feminists advocate separatism and recommended women-only spaces, free of male domination. For well over a decade these four early positions were taken up individually and in combination. Overall and in an assortment of ways, each set of early theories ignored or sidestepped the significance of historical, sociological, and cultural differences among various groups of women in the United States and often offered very inaccurate and paternalistic representations of women's lives in other regions of the globe. As paradigms shifted and, more importantly, Women's Studies scholars and activists engaged in self-criticism, the range of established theories was thoroughly analyzed and examined for various shortcomings and exclusionary practices.

One of the significant pieces that challenged 1970s feminist scholarship based in the United States and the west was Chandra Talpade Mohanty's scathing essay "Under Western Eyes" (1984). That influential article charged that the universal images of "Third World Women" constructed a reductive and homogeneous notion of what she called *Third World difference*. According to Western feminists at the time, women constituted a coherent group with identical interests and desires, regardless of class, ethnic or racial background, or contradictions implying a notion of gender or sexual difference or even a patriarchy that was universal. The oppressed Third World Woman from the underdeveloped regions of the globe was defined as bound by traditions of religion

and family, unsophisticated, not conscious of her rights, illiterate, backwards, and sometimes revolutionary. This image of "the other," meaning non-White, non-Western women, possessed all of the seemingly negative attributes just listed. The Third World difference provided a binary, predicated on assumptions that Western women were liberated, secular, and in control of their own lives. Paraphrasing the title of a popular text of the time, sisterhood was far from being global.

The question still remains for Women's Studies academics on how to include all of the voices and experiences of women. Feminist scholars Carole McCann and Seung-Kung Kim note that feminist theories provide intellectual tools with which to examine the injustices they confront and build arguments to support their particular demands for change. On the basis of this knowledge, the seemingly overwhelming job left to do includes developing strategies for resisting subordination and to improve women's lives. Some of the questions that feminist theorists respond to include: How are women subordinated as women? How can we understand the ways in which specific events might be part of social oppression based on sex, rather than unique individual misfortunes? How can we be sure that we have clear understandings of oppressive situations? How can women resist subordination? How should we work for changes that will improve women's lives? In what arenas of life should we focus efforts for change? What kinds of changes are needed? How is women's subordination as women connected to related oppressions based on race, ethnicity, nationality, class, and sexuality? These questions rest on ontology, epistemology, and politics, as the ultimate goal for feminist theories is to help make sense of women's situations and effect change. Overall, Women's Studies, like the women's movement itself, is deepening, refining, and broadening its scope of understanding of how gender inequality operates, how it intersects with other systems of domination wherever they are found, and how to make some universal claim. Women's lives and experiences are located in context on local (indigenous and regional) and global (transnational) levels. How those in positions of power and privilege differentially subordinated and oppressed women by class, race, ethnicity, sexuality, disability, and other distinctions that may be marked and unmarked continues to engage feminist scholarship throughout the world.

Differing Experiences Within Women's Studies

One of the ways that feminist scholars explored the differences and commonalities of women's experiences was to examine how this occurs in what particular situations. As anthropologist Johnnetta B. Cole remarked in her classic piece "Commonalities and Differences" (1986), "while oppression of women knows no limitations, we cannot therefore, conclude that the oppression of all women is identical." Intersectionality highlights how social groups are positioned within unjust power. According to Patricia Hill Collins (2004), a group's history and location can be seen as points of convergence within structural, hierarchical, and changing power relations. An example of how this underlies everyday life in 21st-century middle-class America is in the use of the term *JAP*. Jewish women, like women throughout the United States, are "trying to find their own paths and their own voices." What better way to deter a strong woman than to label her a *princess*? Calling her a princess diminishes her and negates her ambition and her success. Further, the total phrase underscores stereotyping of Jewish women and men. The term *JAP*, therefore, is a code word that symbolically articulates anti-Semitic messages. It is connected with women, the Jewish American *Princess*, because women are achieving in many arenas of the society that threaten many men, Jews and Christians alike.

Over the years, a growing body of literature illustrates the complexity of women's lives across the various boundaries that divide and bind them. The power of an interdisciplinary approach allows scholars and activists to use their particular focus in consort with other methods in addressing these issues. Poets and cultural producers have led the way to illustrate what appears in their lives. Gloria Anzaldua's prophetic essay "La Conciencia de la Mestiza" speaks in multiple voices. Written in Spanish and English, it addresses the multiple identities of Chicana-Chicano life, the *mestiza*—products of Native American and Mexican—situated in the United States. She writes,

I am possessed by a vision . . . that we have taken back or uncovered our true faces, our dignity and self-respect. Seeing the Chicana anew in light of her history. I seek an exoneration, a seeing through the fictions of white supremacy, a seeing of ourselves in

our true guises and not as the false racial personality that has been given to us and that we have given to ourselves. I seek our woman's face, our true features the positive and the negative seen clearly free of the tainted biases of male dominance.

Audre Lorde, a Black woman warrior, mother of two children, educator, Poet Laureate of the State of New York, lesbian, and activist described what was critical for the future: "We must recognize differences among women who are our equals, neither inferior nor superior, and devise ways to use each others' difference to enrich our visions and our joint struggles." These calls for understanding commonalities via understanding the differences became a benchmark in postmodern thinking in feminist discourse, bridging the humanities and the social sciences. Sociologist Chela Sandoval (1990) advocates "a theory and method of oppositional consciousness" that denies any one ideology or identity as the final answer. In this democratizing practice, ideologies and identities move freely, engaging one or another, or several at the same time. In a similar vein, Egyptian feminist Nawal El Sawaadi argued,

men and women everywhere have struggled against foreign invaders and economic and cultural oppression. They make distinction between their minds and bodies. Dissidence is a natural phenomenon in human life. We are all born dissident and creative. Dissident people liberate themselves from fear and they pay a price for this process of liberation.

Actions taken by women on their own behalf or as a member of a group are ways of challenging the status quo and are an actual method of the oppressed. An early declaration of lesbian politics and identity in the United States by Charlotte Bunch (1972) addressed the source of oppression faced by women who personally reject heterosexual sex. The lesbian threatens the ideology of male dominance in its most individual and common form. By challenging patriarchy, a sex-gender system in which men dominate women and that which is considered masculine is more highly valued than that which is considered feminine, lesbians confront homophobia on cultural grounds and in societal institutions. In the volume *This Bridge We Call Home*, Max Valerio explains his transformation physically, mentally, and spiritually

from female to male. He buried his male gender identity for years by cross-dressing and identifying as a lesbian and entered same-sex relationships. After undergoing surgeries and medical treatment, Valerio slowly emerged as a man, a transsexual person who now sympathized with feminist and lesbian issues, but identifies with transgender concerns and that particular community. Gayatri Gopinath questions universality of the Queer Nation as a counterhegemonic model of transgression and resistance. The concept of the Queer Nation does not fully address the limitations of citizenship faced by many queers of color. The term *queer* is gender-neutral shorthand that signifies a range of alternative sexual activities and sensibilities in a way that lesbian or bisexual or gay do not. Addressing circumstances of queer south Asians in the diaspora, "citizenship," queer or otherwise, is not something that they can ever take for granted. Queers of color, in various diasporic settings, enact a complicated navigation of state regulatory practices and multiple national spaces. Queer South Asian practices are evidenced in popular cultural forms, such as *bhangra*, folk music originally from the Punjabi province of India. Bhangra has been transformed through other musical performances of the African diaspora, such as house, reggae, and rap, in counterpublic spaces in New York, London, and Toronto. These transgressive activities might be acts of resistance to hetero-normative practices and ideology, but they are also particular to the histories and situations of queers of color who interact on multiple levels of society.

Sexuality of whatever form—heterosexual, gay, lesbian, bisexual, transgender—all calls to question gender role expressions. The ideological hetero-normative, male-dominant construct puts a stamp on the way a society and culture perceives and orders certain experiences. Symbols of society give meaning to objects, including colors; words housed in the prevailing ideology construct reality. Images—a medium of expression—depend on the symbolic association of the perceiver gradually shaping his or her reality. Images of women influence conduct and the cultural representation that govern the behavior of others. Signaled in language, gestures, and actions of the dominant discourse, Women's Studies contests the prevailing notions and images of women across the commonalities and differences that are sources of oppression.

Images, Bodies, and Symbols

The media constructed an image signifying the threat of the Women's Liberation movement to United States society. This image was the "bra burning" by feminists who protested the 1968 Miss American Pageant. But, in fact, there was not one bra burned at that event. During the protest, a 10-point proclamation of issues and concerns were presented to the press outlining what that pageant really represented, which was the "ideal" woman artificially constructed for commercial purposes. What this media invention, "the bra burner," created was a heightened awareness of how women's bodies were objectified in the culture through all kinds of media and mythologies. The brassiere, a 20th-invention made popular by the Maidenform Corporation, controlled and contoured a woman's body into a shape that she did not necessarily possess but perhaps desired to have so as to be attractive and beautiful. "The beauty myth" permeates United States culture as women seek this physical ideal to be successful and to attract men. Standards of beauty vary from culture to culture and change over time, but in the United States, the prevailing notions of beauty emphasize being young, thin, White, and Anglo-Saxon. There are thriving businesses in liposuction, intestinal bypass surgery, gastric stapling, and jaw wiring to achieve the ideal body. In addition, there are eating disorders that bridge the physical with the psychological needs to fulfill expectations of what makes one beautiful in the eyes of society. As a symbol of femininity, beauty standards are controlled by the images that govern behavior. Nellie Wong conveys the power of this beauty myth in her poem, "When I Was Growing Up": "When I was growing up, I read magazines and saw movies, blonde movie stars, white skin, sensuous lips and to be elevated, to become a woman, a desirable woman, I began to wear imaginary pale skin." Like the Chinese Nellie Wong, other women of color could not fit that ideal either. Images of stereotypes, degrading ideologies of race, ethnicity, and social class were all interwoven in the racism faced by women of color in the United States. Noliwe Rooks studied the constructs and history of how Black women perceived notions of beauty and what they need to meet the ideal: "The presence of blackness precludes gender identification as well as the possibility of femininity for African American women. The beauty standard here is not merely proximity to

whiteness but whiteness itself.” Continuing this conversation, Leith Mullings remarked, “The mammy and jezebel stereotypes, evoked at different historical periods and applied to women of different ages and phenotypes, are variations of the Madonna/whore dualism.” The “hot woman” image persisted for African Americans that also included the stereotype of the tragic mulatto Jezebel. As a product of sexual aggression on the part of her progenitor, the tragic mulatto was presumed to be promiscuous, thereby continuing a set of behaviors as an almost genetic predisposition. Another version of this stereotype is the “Latin spitfire,” whose fiery temperament was caused by mixed-race parentage. Throughout most of the 20th century, the servile, defeminized Mammy, whose media image appeared as Aunt Jemima on pancake boxes, still conveyed images of the faithful, obedient domestic. African American women working outside of the home, often in servant roles, were vulnerable to sexual exploitation. In a similar situation, Euro-American working class women who worked outside of the home also became symbolic of “whorish behavior.” Stigmatizing the subordinate also functions to constrain women of the dominant group. “Women, who by accident or design threaten the hierarchy of the social order are labeled ‘bad women.’” Who are those bad women? They are women engaged in the struggle against oppression in their own location and on the transnational levels where movements of people, ideas, and resources cross national boundaries. No longer is the label “Third World Women” applicable, as feminist activists and scholars from the global South (including marginalized groups in the North) represent themselves in global forums and form linkages, networks, and alliances within a global civil society. They are the ones El Sadaawi acknowledged as the time-honored dissidents who have always struggled against oppression.

Women’s Studies validates the potential for change in society, it challenges the assumptions that women’s inferior status is natural, biologically determined, uncontested, and consistent throughout the history of humankind. Because women live in so many different social, economic, cultural, and political circumstances, there is no best strategy for change, but hope is an underlying theme of such activities.

WORK AND SKILLS

Work is the labor, task, or duty that is one’s accustomed means of livelihood. Anthropologists among social scientists have debated the significance of work in industrial and nonindustrial societies. In anthropology, emphasis is given to the association of the work concept to pertinent social relationships.

Skills are learned powers of competence, developed aptitudes, or abilities. Skills develop in areas of art, technology, language, and other forms of perception and expression. By analyzing skills and the processes that bring skills about, dichotomies, such as those that exist between art and science and high and low technology, may be overcome. Nevertheless, the extension of human skills through technology has resulted in the historical withdrawal of people from the production processes and in changes in the types of needed skills.

A contrast between the values driving work patterns in “Western” and “non-Western” societies often has been made in the field, following the writing of Max Weber, Émile Durkheim, and Karl Marx and Frederick Engels. Marx and Engels emphasized the evolution of modes of production, or the ways raw materials are converted into commodities through labor. Émile Durkheim’s concept of division of labor differentiates work, morals, and law in organic solidarity societies that stand in contrast to the likeness of work and consciousness in primitive mechanical solidarity societies. Weber emphasized social values and traced the rise of a capitalist economy to the Puritan determination to work and do good deeds. Subsequent economic and political ecology approaches have emphasized exploitative labor practices, hegemonic ideologies, socioeconomic differentiation, and globalization. In the moral economy, internal statuses are seen as more egalitarian. Lay concepts about the alleged laziness of

indigenes follow ethnocentric notions, and are successfully countered in anthropology through cultural relativism and understanding the embeddedness of economies in social and religious practices and beliefs.

Marshall Sahlins makes a case that the activities that individuals and communities perform are embedded in their social relations, roles, and statuses. Similarly, Tim Ingold argues there is no need for the specialized concepts of work and workers among hunter-gatherers and other nondifferentiated societies. Ingold redefines work in such contexts as task orientation. Work is life for foragers, and the relevant distinctions made are not between work and nonwork, but between different types of activities, such as farming, weaving, child rearing, and so forth. Task orientations are carried out through skills.

Hunter-gatherers can develop finely tuned skills at reading animal signs and tracks, moving silently during the hunt, butchery for full use of the prey, as

well as identification of edible and nonedible plants. Shamans and religious leaders in traditional societies have tremendous oratory skills. Skill at communication is an important ability for social leaders in non-industrial societies, including the ability to memorize, recall, and manipulate genealogies and ancestral spirits to produce favorable outcomes. Apprentices are engaged in the process of learning skills.

Whereas some anthropologists view human technological development as a driver of human social evolution, others have pointed out that many of the skills important in nonindustrialized societies are equally as important in industrial ones. The social atomization of families in modern state societies may be a manifestation of the dependency on mechanical

devices and technological proficiency rather than the deterioration of skills.

 XENOPHANES

Xenophanes was a Greek Presocratic philosopher, poet, rhapsode, and social and religious critic. Born circa 570 BC in the Ionian city of Colophon, Xenophanes spent a long life of “traveling counselor” and wanderer about the western Greek provinces, mainly in Sicily, once for a time associated with Elea on the Italian southwest coast, where he reputedly became the precursor or perhaps even the founder of the Eleatic school of philosophy with his famous student Parmenides. He was then for decades a celebrated teacher in the Pythagorean school and died circa 478 BC in Syracuse. He wrote in verses and most of his philosophical poems, which have survived in a considerable body of fragments, present his satirical standpoint. He was critical of many traditional religious worldviews as presented by Homer and Hesiod, based on the teachings of the Milesian philosopher–scientists (Thales, Anaximander, and Anaximenes), whom he admired and sought to follow. Xenophanes himself was deeply involved in some natural science observations and speculations, mostly in meteorology. From here he derived his ontology, according to which the “clouds” (*nephos*) form the substance from which many natural phenomena come, and thus the explanatory principle analogous to water, air, or earth in other Milesian natural philosophers. The main targets of his poetic ridicule were polytheism and anthropocentrism of Greek mythology. His philosophical idea that there is a changeless, motionless, and eternal “One” has found its expression in the novel conception of divinity (the idea of “one greatest god”). Thus Xenophanes is one of the first monotheists and even pantheists, and a religious reformer who considered traditional mythology ethically corrupted and cognitively wrong. His was the remark that “humans have

made gods according to their own image” but he urged humans to stop thinking of gods as humanlike, and of themselves and the Earth as the center of the universe. His famous argument was that if horses or oxen or lions had hands and could produce works of art, they too would represent the gods after their own fashion. Through and following the reforming of popular religious thinking, he aimed at reforming human social life in the name of its greater stability, well-being, and deeper ethical value (e.g., he opposed useless luxuries and honors paid to sportsmen, although he advocated the censorship of poets). Xenophanes also introduced several important epistemological ideas, such as that knowledge must be broader than what we actually perceive. We can hardly grasp that nature of things, which is beyond our direct observation. To act, however, human beings necessarily use their opinions as if they were the truth. This is traditionally interpreted as skepticism toward human abilities, both perceptual and conceptual, to know a real truth. Thus Xenophanes previewed Plato with the distinction between knowledge and opinion. Xenophanes represents one of the most important figures in the way of human and anthropological thought from *mythos* to *logos*.

XENOPHOBIA

In the modern world, the diversity of cultures on this planet becomes more evident when seen in the process of globalization. Both internal and external conflict during this process is certain, whereby overt and covert actions threaten a population's autonomy, sovereignty, and nationalistic state. The resulting psychological state becomes that of xenophobia. Xenophobia is the psychological reaction of an individual who has a fear or contempt response to anything that is culturally foreign. This reaction can manifest itself from extreme isolationism to extreme aggression. When viewing the process of globalization and multiculturalism in an evolutionary framework, the resulting xenophobia may be viewed as a natural response to cultural incursion. Preservation, as will be seen, is a result of acute perception and successful behavioral adaptation.

Although some psychologists and philosophers, including natural theologians, would be reluctant to admit the pivotal role that biology has on human behavior, the unfolding potentiality of the DNA results in the adaptive behavioral response on both an individual and social level. When viewing an individual as evolutionary chance, the adaptive behavioral responses can be understood in terms of an Evolutionary Stable Strategy. Any behavior that would tend to increase the chance to reproduce successfully would be opted. When expanded to the level of a population, individual cost-benefit analysis would dictate behavioral action. Although similarities in phenotypic expressions (for example, genetic distance) would be a strong motivating factor for group behavior, reciprocal altruism seen at large-scale populations would be influenced by cultural factors that extend beyond close kin-based social systems. Xenophobia becomes an actuality of these intense egoistic tendencies transferred into a population.

Understanding the cultural expressions for this psychological phenomenon is the key for behavioral modification. Although complete modification sought by proponents of multiculturalism can distract from the main issues, the significance of cultural determinates for the individual becomes an integral part of shared group cognition. Although the cultural history of our species can be seen in the archaeological record, these remnants can be seen as a physical representation of active *memes*. In short, *memes* are bits

of cultural information that are transmitted from individual to individual. These memes take the form of ideas, languages, and their physical extensions. Through the process of imitation, memes have modified the way by which our species exist. Modifications from these memes, which has resulted in genetic variation, gave rise to opportunity for our species to populate the globe. Within historical time, small remote populations of our hominid ancestors would eventually give way to civilization and the development of the state.

With the advent of civilization, our species probably experienced the greatest qualitative and quantitative degree of the xenophobic phenomenon. Although nomadic populations would experience a small degree of xenophobia (for example, in justification of territorial disputes), civilization constructively used the phenomenon as an internal control. Building upon natural tendencies found within our species, each population's values, expressed in folk, mores, laws, and mythology, creates the deep-seated feeling of nationalism. Nationalism does not only act as a cohesive force, but the guiding level by which the xenophobia is allowed to express itself, defining citizenship and civic duty.

With the expanding social structure and greater encompassing cultural ideologies, individual identity is taken from and contributed back to the social structure. Geographic location, genetic distance, and enculturation become central to group acceptance. When viewed politically, it becomes a question of citizenship. Expressed in terms of a political social contract, the importance of citizenship becomes evident: Acknowledgment of an individual by a political body brings inherent social benefits and obligations. The underlying structure of the cultural base of the nation-state, by which was created and sustains political structure, becomes a pivotal reliance for the differentiated individuals in a population group. Essentially, the individual views others as part of an extended family; not foreigner, but countryman. In the midst of environmental uncertainty, where personal mortality becomes highly probable, having citizen status becomes beneficial. However, citizenship does have a price. Defending and supporting the state against enemies, both internal and external, can be overwhelming; yet, the cost-benefit analysis gives greater weight for political unity. Examples can be seen in the historical analysis of the Greek city-states and the Roman Empire. The two examples show the

extremes, the Greek based on geographic location and the Roman based on the acceptance of Roman ideals and culture.

Taking a cue from social constructs, especially seen during the classical period, the development of these united groups creates two distinct categories: *us* and *them*. During the creation of these ethnocentric ideals, the outsider is considered to be subservient and inferior. Reflexivity being critical in the psychological development of the self, marginal individuals (for example, slave and lower class) accept the social status. Reinforcements, both negative and positive, continue to regulate and subjugate those whom society has deemed unworthy. Although citizenship is a positive step for those who are disenfranchised, social and cultural acceptance rarely succeed. For the most part, citizenship does provide a meager means for social mobility. In this manner, when people of marginal status acquire dominant values, there is a greater degree for social advancements. This in turn will increase the chances for survival. Accounting for the nature of these biases within social dynamics is the key to our sociobiological behavior of our present and future interactions.

The sociopolitical experiment created by the founders of the United States was a quantum leap forward from the traditional political and ethnic systems of continental Europe and England. Although the original 13 colonies claimed to be Englishmen proper, the combination of both financial and intracultural xenophobia by England had caused rapid deterioration and open conflict. The imperialistic impetus may have reduced xenophobia to flirtation with novelty, yet any action that would directly challenge the sociopolitical structure would be suppressed. As the United States gained independence, internal xenophobia would continue to express itself in both political ideologies and civil law, just as it did in the former mother country, England.

With the creation of a country where opportunities and social mobility were possible, an influx of immigrants (especially during the 20th century) from different cultural backgrounds gave the country a unique identity. However, these segments of populations remained "separate but equal" in the name of toleration. Discrimination and violence (for example, slavery and religious fervor) set the tone for sanctions against those that would deviate from the norm. In this manner, xenophobia could be extended to the puritan ideals concerning religiosity (for example,

including sexuality and the occult). Even in the light of newly gained civil freedoms, the cultural flexibility of what was considered to be "American" was from the multicultural ideal. American culture did have a unique flavor that set it apart from its European counterpart; yet the social stratification reflected, to varying degrees, the internal xenophobic reaction. This would remain throughout the development of the United States. However, through liberal and active legislation, the embracing of pluralism and soon-to-be multiculturalism posed as an interesting variable within the social experiment.

The best solution considered for the xenophobic reaction is education. A proponent of cultural pluralism, the psychologist William James (1842–1910) rejected the basis of xenophobia and ethnocentrism as a Darwinian model of social selection. Viewing his public activism, James sought equality for those who were subjected to racist or discriminatory practices. James believed that through education, an environmental factor, the impressions upon the mind could reduce or offset the cultural impressions that occurred during early development. This in turn would reduce or eliminate xenophobic behavior or habits. The degree to which the habit would change is not predictable, due to the weight of individualism within the realm of pragmatism.

Considering this perspective, especially in light of an evolutionary framework, James's framework must incorporate basic principles of evolutionary thought. James accepted these basic principles. In this view, natural selection and sexual selection created the basis of the diversity of life. Although he acknowledged the role of religion in an individual's life, the origin of our species' social structure was without divine or Aristotelian structure. Viewing social selection as reflecting dominant group values, the resulting ethnicity is seen as an adaptation in progress for the selected group. Although there are many internal contradictions within his philosophical view, the equality in weight of each culture depicted his view of pluralism. This would be extended into areas of moral or ethical views.

In an attempt to reconcile Darwinian evolution with some form of cultural relativism, James, as well as John Dewey, viewed each culture with a sense of understanding. Although rejecting the notion of superiority of one culture at the expense of another, every culture can be seen as reflecting the mode of production by which each society operates. Development,

as depicted by growing complexity, still retained the evolutionary perspective; yet there was a given commonality or uniting ties among populations of the world. James warned against romanticizing the “noble savage” and more simplistic lifestyles: He valued them with compassion, but gave the more complex and advanced societies an elevated status among pluralistic cultures. Essentially, each stage of social evolution reflected or retained some essence of previous stages within their evolutionary past. In modern societies, these valued perspectives would be modified or subjected to the process of alienation. Just as seen by the philosophy of Karl Marx (1818–1883), this alienation can manifest itself in various forms of conflict. With social conflict eminent, the role and existence of xenophobia appears to be certain.

As the United States experiences the trials and tribulations of a growing republic, multicultural policies and social integration attempts reflect more of a utopian ideal than a reflection of our species’ social structure. Even though race is understood as being a social construct, the cost–benefit analysis based on phenotypic expressions (whether they are inclusive) is real. Cultural expressions are equally, if not more, important in the psychological stability of a population group. Even though culture and genetic distance do have a great effect upon behavior (reciprocal altruism), sexual selection does have great importance in the “desirability factor” of the process of reproduction. Granting the selective power exhibited in the social realm, individual genetic fitness and expressed variation appear to operate on a more determinate level. The behavior expressed on this level is beyond the confines of culture. Deviants from the sociocultural norm will receive sanctions. The cultural rules become more complex if new cultural variants are added within the population. The resulting xenophobic reactions are patterns of behavior reinforced to ensure the survival of a closely knitted genetic group. Although xenophobic actions can be reduced by diffusion across minor degrees of cultural variation, differences will be seen if independent and distinct states are united. This will be seen within the European Union.

To offset the economic and political power of the United States, the European Union used the same constitutional provisions enacted by the founders of the United States. Acknowledging the American political genius reflected by the creators of this unique document, the European community has attempted

to unite the diverse populations and their respective cultural backgrounds. Plagued by centuries of war and strife, a peaceful union among conflicting ideologies seems impossible, yet practical. Can the segmented genetic populations of Europe that are separated by language, customs and traditions, and philosophies unite? Will old rivalries and imperialistic tendencies that support the prevalent economic structure impede the process of uniting? Although our species must remain optimistic and the desire for peace remains strong, the suggestive power of both history and mythology (including religion) will be a source of conflict and present an immovable barrier. When calculating the cost–benefit analysis, the degree of reciprocity will be questioned. Considering the cultural relevance and genetic distance, will the countries of economic and military prowess surrender their sovereignty and position for the rest of the European community? Other than a gesture of good will, the welfare of the industrialized countries will always take precedence over other less advanced or economically sound countries. Any threats to the stability of said country, external or internal, will result in an inversion to a degree of nationalism and xenophobia. Internally and externally, these problems will continue to be present within the mainstream dominant culture.

In order not to oversimplify or underestimate the structure of the European Union, the problems facing Europe are unlike those facing the United States. The United States is dominated by one language (not yet official), tradition (combined), and inclusive geographic location. More importantly, the sovereign states share a common history and growth, perhaps a sense of manifest destiny (1841–1848). The roles of the state and federal governments are clearly defined and practical. Even if multiculturalism is not central to the issues at hand, the resulting empathy is serving as a process of further uniting and seeking out cultural universals among many particulars. Unlike the United States, the European Union does not have a common language, custom, or a sense of cultural unity. In the area of civic history, known past aggressions and alliances serve only to strain the relations among countries in the union, producing mistrust and civil discord. These diverging facts make the attempted union problematic. Unless a union of culture, including language, is attempted, the process of unification will be impossible. There must be recognition of the underlying philosophical role concerning cultural adaptation.

Taking an evolutionary view of xenophobia, the hidden biases steeped within culture are evident. The smaller the population of a group, the greater the degree of xenophobia for cultural purity will be seen in the face of cultural incursion. Additionally, the use of natural recourses becomes another factor in the cost–benefit analysis faced by ethnic groups. Although phobias are considered irrational, the emotional sediment shared at a group level is legitimized politically, sometimes religiously. Whether the results are discrimination or a “holy war” of terror, the xenophobic actions have consequences in the global theater.

As a republic, the United States has shown great restraint toward those who display aggressive xenophobia actions. Attacks upon the sovereignty of the United States (September 11) are a declaration of war. Covert actions coupled with religious fervor sets the tone of future conflicts. This reality, in conjunction with a political socialistic “pie in the sky” mentality, creates a disjunction whereby the enemy and treason can flourish. Were the following statements xenophobic or statement of fact? Although a political statement is certain (conservative or liberal), xenophobic underpinnings are present in form of nationalistic ideology. It is easy to see how such statements can arouse emotional sediment. These alarming words, however functional and necessary they may be, can increase xenophobic reactions in others. In terms of individuality, these actions are not only justified but are beyond moral qualifications. Survival is essential, not optional.

The quandary that faces our species has been the subject for philosophers for centuries. Defining

humanity in terms of ontology and teleology has given our species a start into understanding ourselves in relation to the world. Refinements in science have brought new insights into the human predicament. Advancements in biology and the cognitive sciences continue to redefine humanity. Perhaps accepting common values and traditions can be the beginning of reducing xenophobia, but its elimination will require something more critical than education. As evolution produced the question, evolution may someday give the answer.

YABARANA INDIANS

The Yabarana are an Orinoquian indigenous group of Amazonas State, Venezuela. Most live along the banks of the Parucito River in villages with a male leader or in the town of San Juan de Manapiare. But the Parucito River is their stronghold. The Indigenous Census of 1992 reported a total of 319 Yabarana, a figure that may not be accurate as that census was fraught with conceptual and methodological difficulties. The previous census (1982) listed 155 Yabarana. Although linguistic, cultural, and historical specifics place the group within the broader Carib-speaking family, contemporary Yabarana are the product of ethnogenesis that led to the merging of neighbors and refugees. The various ethnonyms used for them echo this story, (for example, Wökiare, Yawarana, and Orechicana).

The Yabarana have intermarried with members of nearby groups such as Piaroa, Panare, Ye'kuana, Hiwi, and a handful of non-Indians. However, Piaroa–Yabarana marriages are the most common. Due to this and the fact that the Piaroa dominate the area demographically, many Yabarana speak or understand Piaroa. But few Yabarana speak their own language even though they can understand it. Their language may not survive unless a concerted effort is made to revitalize and maintain it.

Depopulation played a major role in their transformation. Its impact on Yabarana sociocultural beliefs and practices must be understood in the context of the colonial history of the region, which included, among other events, the introduction of foreign diseases (for example, measles), slave raiding by the ancient Caribs, changes in native leadership structure as a response to the colonial situation, and the transformation of

indigenous villages and work patterns as forest crop extractors, missionaries, and government officials penetrated the region. A major transformative event was the rubber boom, which in Venezuela dates from the second half of the 19th century to the middle of the 20th. Due to the demand for labor, members of various native groups—including the Yabarana—were relocated along the Orinoco, Siapa, Casiquiare, and Río Negro rivers during this period. Consequently, most Yabarana have only a fragmentary knowledge of their former ritual practices and elaborate oral tradition. But out of these fragments, and the fact that most Yabarana have always inhabited the same general area, a collective sense of history and identity emerged. Today this collective history and identity is reinforced by the threat that cattle ranchers, non-Indian immigrants to the area, and prodevelopment policies pose to their lands. Like other Venezuelan Indians, the Yabarana's political participation has increased not only because of land tenancy disputes, but because Venezuela's new constitution (1999) grants them unprecedented rights. One of San Juan de Manapiare's recent mayors, Benjamín Pérez, is partly Yabarana and identifies strongly with the group.

Yabarana subsistence practices include slash-and-burn horticulture, with bitter manioc as the staple crop, fishing, hunting, and the gathering of some wild foods such as palm fruits. Men are the primary providers of fish, although women also contribute, generally with smaller species. Men and women will use fishhooks and participate in *barbasco* (fish poison) fishing trips; however, fishing with bows and arrows or harpoons is considered a male pursuit. The men hunt and collect most of the wild honey by smoking the bees out of their hives. Today most hunting involves the use of shotguns (associated with men) and flashlights or lanterns for nighttime

hunting. Formerly men employed the blowgun, spear, the bow and arrow, and a variety of hunting traps for small and large animals. Hunting, particularly of larger game, has decreased as animal populations decline. Both men and women work in the gardens but men fell the trees when a new garden site is cleared and women do most of the weeding and harvesting. Some, mostly the men, work for local nonindigenous Venezuelans (known as *criollos*) and cattle ranchers on a seasonal or temporary basis. A handful of women have done maid's work while in San Juan de Manapiare or while employed by a ranch, yet most do not sustain these activities because they have their own families to care for.

Yabarana family structure is fluid and most nuclear family units include one or more near relatives on at least a temporary basis. Extended families were common in the past (the late 1940s or early 50s). Cross-cousin marriage was customary and remains an accepted practice, though it is difficult—given the small population size—for the Yabarana to find mates within their own group. Bride service was traditional, and today some sons-in-law perform modified versions of it. For instance, a son-in-law will work for a local rancher but will visit his in-laws when he is off duty and bring them commercial goods or help them with house repair or garden work or other chores. Although Yabarana parents are more accommodating about this than in the past, they are adamant about the need for couples to support their offspring. Recalcitrant sons-in-laws and daughters-in-law are relentlessly chastised, particularly by mothers-in-law.

Today the Yabarana no longer have shamans, although most have some knowledge about medicinal plants and a handful know how to perform love magic and other rituals. Most believe in a universe populated by a variety of spirit beings even when they profess some knowledge of Christianity. Their oral tradition attributes the makeup of the world as we know it to the actions of various characters, in particular to the brothers Mayowaca and Ochi and their adventures. They were exposed to Christianity by Catholic and Evangelic missionaries in the multiethnic town of San Juan de Manapiare. The Catholic Church maintains a mission and school in that town and offers regular masses, yet most Yabarana do not attend church services and only complete basic schooling. When the services of a shaman are needed (for example, a person gets sick because the master of an animal species took revenge for some breach), they

seek out shamans from other groups (for example, the Piaroa). Diseases deemed curable with Western medicines are generally treated at the infirmary in San Juan de Manapiare. This flexibility has no doubt contributed to their survival.

Since the early European-natives encounters, two main groups were identified in the southernmost region of the archipelago of Tierra del Fuego. Those groups were the *Yaganes*, or *Yámanas*, in the region of the Beagle Channel and the *Alakalufes*, in the southwestern Chilean archipelagos (the Pacific Ocean end of the Strait of Magallanes). Yaganes are usually known as *Yaghans*, after an erroneous designation. There is still uncertainty among students of Fuegian natives of the accuracy of their names, origins, and the boundaries separating their territories; nevertheless, their lifestyle and economies seemed to have differed only slightly. Some scholars recognized only a linguistic difference between these two groups. Both Yaganes and Alakalufes are known for their nomadic characteristics, a mobility attributed to their canoe lifestyle. Their way of life could have conditioned their stature, as they were shorter than the rest of the aborigines in the area.

Canoes were used to travel along the shores or from one island to another for the provision of food from both marine and littoral natural resources. This is the reason why they spent half the year sailing. Usually, the whole family traveled together with their belongings, which consisted of weapons, food, and tools. Anthropological evidence in the region indicates that the southern foragers of Tierra del Fuego

carried a basic tool kit that included large projectile points, scrapers, wedges, and harpoons that were used for fishing and hunting. The most common prey were the seals, which were also the most important nutritional resource. Additionally, birds, fish, shellfish, and *guanaco* or *huemul*, only when available, were consumed. Mushrooms and berries complemented their alimentation. Yaganes did not have the technology needed to regularly capture cetaceans. They could take advantage of this resource only when a whale stranded on the beach. This situation was among the few that generated contact with their neighbors, the *Onas* and the *Haush*. Also, the sharing of the prey manifested solidarity between the aborigine groups in the immediate area.

The basic social unit was the family. Family members equally shared the responsibility of food provision. Families were related to each other, but for the most part Yámanas and Alakalufes alike lived in isolation. They had temporary campsites on the channel's shores, particularly during hostile meteorological conditions or when youngsters were inducted in religious ceremonies similar to the *Onas*'s social induction rituals. Due to the severe climatic conditions in which they lived, some authors claim that Yaganes carried fire aboard the canoe to keep warm, particularly since they wore negligible clothing (a custom that led to Charles Darwin's misjudgment of Fueguians utter primitivism). Indeed, researchers suggest that this group, instead of experiencing cultural archaism, had an excellent ecological adaptation to the environment primarily based on a selective hunting strategy of seals. This strategy not only allowed the animal population to remain stable over time but also to secure the main source of their energy intake. Some anthropologists suggest that the reduction of seals due to European sealer activity in the area might have triggered the change in natives' food consumption to the detriment of their health and well-being.

Briones, C., & Lanata, J. L. (Eds.). (2002). *Archeological and anthropological perspectives on the native peoples of Pampa, Patagonia, and Tierra del Fuego to the nineteenth century*. Westport, CT: Bergin & Garvey.

As one of the most famous of all cultures in anthropology and beyond, the Yanomami are ethnographic celebrities. They are a large population of indigenous people living in a vast area of some 192,000 square kilometers in the Amazon rain forest. The heart of their homeland is the Sierra Parima, part of the Guyana Highlands, the mountainous divide between the watersheds of the two most famous rivers of the Amazon region, the Orinoco and the Amazon itself. Their territory overlaps the border between northwestern Brazil and southeastern Venezuela. Some 21,000 Yanomami reside in 363 scattered communities that range in size from 30 to 90 individuals with a few reaching more than 200 in size. Although very little archaeological research has been conducted in the area, two other independent lines of evidence, linguistics and blood group genetics, indicate that the Yanomami have been a separate population for 2,000 years. Their language remains classified as independent, unrelated to any others on the continent of South America.

Surely among the reasons for their survival for millennia is one of the most outstanding attributes that distinguishes this unique culture, reciprocity. It is a pivotal social principle applied in almost every aspect of their daily life, and most commonly through kindness, sharing, cooperation, and camaraderie. However, this principle is also applied in resolving disputes, occasionally even through violence between individuals, groups, or villages. In various ways reciprocity extends beyond ordinary life to their relationships with the spiritual component of their world as well. For example, every Yanomami hunter has a counterpart in the form of an animal spirit in the forest that he cannot kill without seriously endangering himself. The unity, interconnectedness, and interdependence of all life is a fundamental tenet of the religion and philosophy of the Yanomami, another expression of reciprocity.

The Yanomami world is intensely intimate, socially and ecologically. Traditionally people dwell together in a big, palm leaf thatched, communal, round house with a large open central plaza. Their egalitarian society is structured primarily along lines of kinship. In this communal shelter, the hammocks of each nuclear or extended family are arranged around a hearth along the back perimeter. Each village is

relatively autonomous politically with a charismatic headman who can lead only by persuasion in developing a consensus. There is no chief or other authority uniting more than one community, let alone Yanomami society as a whole, although alliances with several other villages are common for economic, social, and political purposes. In Yanomami society the units of residence, kinship, and politics are not isomorphic, but overlap in diverse, complex, and fluid ways. This dynamic is mirrored by the subsistence economy that entails almost daily forays into the surrounding forest for gardening, hunting, fishing, and gathering. Accordingly, individuals accumulate an extensive detailed knowledge of the ecology of their habitat from such regular intimate experience.

Yanomami society successfully adapted to the diverse *terra firme* (interfluvial) forest ecosystems within its territory for two millennia. They developed an ecologically sustainable society in terms of their low population density; limited interest in material

culture; high mobility; rotational subsistence economy; environmental knowledge; and worldview, values, and attitudes. They practice a rotational system of land and resource use not only in their shifting or swidden farming, but also in their hunting, fishing, and gathering. The last three activities emphasize extensive trekking several times a year when they may camp in the forest for a week to a month or so at a time. Their environmental knowledge includes well over a hundred species of wild plants that they use for food, medicinal, and other purposes. Furthermore, their worldview, values, and attitudes usually help promote respect for nature. For instance, they have a system of extensive prohibitions on consuming certain animal species, some of which apply to everyone in the community whereas others are specific to individual circumstances. These food taboos reduce pressure on prey species. Thus, after millennia of use the forest and its wildlife remain intact. The sustainability of traditional Yanomami society is no romantic illusion.

The ancestral homeland of the Yanomami is a region of high biological diversity in several respects: tropical rain forest ecosystems; altitudinal zonation and other variations in climate, soils, and biota from lowlands to highlands; *tepui*s; and *refugia*. *Tepuis*, or *inselbergs*, are isolated tabletop mountains that are like islands of biological evolution with relatively high species endemism. *Refugia* are areas of relict forest surviving from periods of wet and dry climatic oscillations during the Pleistocene. For environmentalists and others concerned with Amazonian ecosystems and biological diversity, the optimum route for conservation would be the continued survival and welfare of the Yanomami and other indigenous societies.

Until recently, Yanomami territory was also a refuge in two other respects, political and cultural. The Yanomami may have retreated to the core of their territory in the Sierra Parima to escape slave raids from adjacent Carib neighbors during the colonial period. They are one of the unique indigenous cultures remaining in the Amazon, part of the cultural diversity of this region that is increasingly endangered through serious violations of the human rights of the indigenous peoples by some colonists, miners, ranchers, government agents, military, missionaries, anthropologists, tourists, and other foreigners.

Although not generally recognized, the Yanomami in Brazil and Venezuela have been influenced in varying ways and degrees for centuries at least indirectly

by Western “civilization,” and sometimes even by direct contact on the margins of their territory. However, only since the 1970s have they progressively become an endangered people, first as the result of the construction of the Northern Perimeter highway that penetrated 225 kilometers into the southern portion of their traditional territory, and since the mid-1980s by the invasion of tens of thousands of illegal gold miners, initially in Brazil, and then more recently also hundreds infiltrating into Venezuela. This cannot be labeled with euphemisms such as cultural contact, acculturation, cultural change, or even catastrophic cultural change—rather clearly in effect it amounts to ecocide, ethnocide, and genocide.

One of the most serious threats of all to the Yanomami in the past two decades has been placer mining, although mainly in Brazil. It is conducted on the land surface by washing away alluvial sediments along river and stream banks with high-pressure hoses and through dredging the bottom of rivers. This causes deforestation, game depletion and displacement, biodiversity reduction, mercury and other pollution, river and stream bank destruction and siltation, and fishery degradation. Subsistence and sport hunting by gold miners, and noise from airplanes and gold mining machinery all combine to degrade the habitat of game and fish as well as deplete and displace their populations. Obviously this has deleterious effects on the animal protein resources, nutrition, health, and disease resistance of local Yanomami communities. Some Yanomami go hungry and even beg for food from the miners, something unknown in their traditional society. For the first time, Yanomami are experiencing poverty and inequality. Other detrimental new practices are introduced such as alcohol abuse and prostitution. Consequently, every aspect of Yanomami society, culture, and ecology is in effect attacked at all levels.

Introduced disease is certainly the most serious immediate threat to all Yanomami. In Brazil, at least 15% of the Yanomami population has already died, mostly as a result of epidemic diseases introduced by the gold miners: tuberculosis, venereal diseases, and even AIDS. The incidence of previously existing diseases, such as malaria and onchocerciasis (African river blindness), has markedly increased as well. Although this medical emergency has long been recognized, and was even predicted in advance of the earlier road construction, the Brazilian and Venezuelan governments have consistently failed

to provide adequate medical assistance for the Yanomami. However, the efforts of the Pro-Yanomami Commission in Brazil together with the French organization called Doctors With Out Borders have brought more medical assistance to some Yanomami communities. Unfortunately, there are no comparable efforts in Venezuela, although the situation appears to be less dire.

There have been homicides and even mass murders of Yanomami by gold miners that were subsequently investigated and documented. For instance, the Hashimu massacre involved a series of events from June through August of 1993. The 12 victims included women, children, and elderly. Several of the bodies were mutilated and some even decapitated.

The miners have brought prostitution that spreads diseases. They have also introduced trade goods that can trigger competition and aggression among Yanomami. They have even given Yanomami shotguns, perhaps to win over friends in areas where they mine. The negative effects on the Yanomami of venereal disease, competition for trade goods, and shotguns may sometimes be inadvertent, or sometimes even intentional.

Although the number of miners in Yanomami territory has declined substantially in recent years from a high of around 40,000 in 1987, there are still regular invasions each dry season. Moreover, changes in the national and regional economies, increases in the price of gold, or discoveries of new kinds of minerals could easily and quickly lead to catastrophic explosions of the mining population at any time in the future with grave consequences for the Yanomami.

Since the 1980s, the territory of the Yanomami nation in the country of Brazil has been turned, in effect, into killing fields because of the illegal invasion of many thousands of gold miners with a multitude of negative health, social, and environmental consequences. However, this disturbing human tragedy is not simply an inadvertent result of the activity of the miners and those who support and profit from their activity. It is also clearly the direct result of the failure of the state and provincial governments of Brazil and Venezuela to adequately protect and promote the human rights of the Yanomami, even though both countries have joined in numerous international agreements on human rights and also have significant protections specified in their own constitutions and laws. After decades of a mixture of governmental apathy, incompetence, corruption, and even complicity,

all of which is well documented in numerous sources, the Yanomami are an endangered society. They will continue to be threatened, unless the international community marshals a much more concerted, systematic, forceful, and sustained initiative on their behalf.

Anthropologists are part of the international community, and some, such as those who are members of the American Anthropological Association, are supposed to follow a formal code of professional ethics that assigns first priority to the welfare of the host community in research. Furthermore, anthropologists have knowledge of some 500 years of recurrent historical trends in situations in which Western "civilization" made war against indigenous societies. From a diversity of sources the profession also has access to substantial specific knowledge about Yanomami culture and ecology as well as the continuing crisis they suffer. Anthropology in the United States and other countries has its own organizations and contacts with relevant governmental and nongovernmental organizations. In short, anthropologists already possess sufficient knowledge to act on behalf of social and environmental justice for the Yanomami. Yet, with few outstanding exceptions, anthropologists individually and collectively have been grossly negligent in this regard.

By now more than three-dozen anthropologists have worked with the Yanomami in various areas and ways for widely different lengths of time. For instance, the eminent Yanomami ethnographer, Jacques Lizot, actually lived with them for more than a quarter of a century. By now more than 60 books have been published about the Yanomami, albeit with diverse approaches, coverage, quality, and accuracy. With so many different anthropologists publishing this much on the Yanomami for more than a century, it is feasible to compare accounts to identify points of agreement, presumably indicative of ethnographic reality, and other points of disagreement, reflecting the individual ethnographer's interpretation, idiosyncrasies, biases, and other phenomena. For example, only a couple of these dozens of authors are obsessed with the violence in Yanomami society to the extent of exaggeration and distortion as well as to the neglect of the violence committed by outsiders against the Yanomami: Ettore Biocca and Napoleon Chagnon. Another important consideration that has yet to receive much systematic research attention is the fact that there is tremendous variation in the

geography, ecology, economy, culture, and history among the some 363 Yanomami villages scattered over the enormous area of 192,000 square kilometers. Communities are located from the Orinoco lowlands into the Guyana highlands within an altitudinal range of 250 to 1,200 meters above sea level.

It is also feasible to identify historical trends in Yanomami studies (Yanomamalogy). The orientation of anthropological research among the Yanomami has evolved to emphasize more humanitarian, applied, and advocacy work in recent decades. Starting in the late 18th century, various explorers and naturalists like Alexander von Humboldt published anecdotal accounts of brief encounters with the Yanomami. Much later this stage was followed during the 1960s and 1970s by salvage ethnography, an attempt to systematically describe as much about Yanomami culture and life as possible. This was guided by the assumption that, as a supposedly "primitive" people surviving from a previous stage of cultural evolution, the Yanomami were destined for extinction in the face of civilization and "progress," or at least for profound cultural change through acculturation and assimilation. The first comprehensive ethnography on the Yanomami was published by Louis Cocco in 1971 after he had lived with them as a Salesian missionary for 15 years. Already at this time there was enough research on the Yanomami by various investigators to allow Cocco to include a whole section on the history of Yanomami studies.

During the 1980s, research on the Yanomami in Venezuela became more problem-oriented, much of it focusing on the causes of their so-called warfare and related issues. Actually the most intense form of Yanomami inter-village aggression is more akin to the famous blood feud between the Hatfield and McCoy families in the Appalachian Mountains between Kentucky and Virginia from 1882 to 1890. In any case, the extended debate about the causes of aggression in Yanomami society was over competing sociobiological and ecological explanations proposed mainly by Napoleon Chagnon and Marvin Harris, respectively. Until Brian Ferguson's subsequent meticulous ethnohistorical research, the Yanomami were falsely treated as some kind of a pristine isolate. In addition, the consequences on aggression and other aspects of their society of the movement of some villages to the lowlands in pursuit of trade goods and other Western resources were mostly ignored. Furthermore, there is no scientific or other justification in affording

internal aggression in Yanomami society so much attention while largely, if not entirely, ignoring aggressive external forces that clearly threaten their survival, welfare, and rights as fellow human beings.

Simultaneously in Brazil, however, with the dire consequences of road construction and then mining in the southern territory of the Yanomami, research in that country shifted in emphasis from basic to applied and advocacy work as exemplified by the heroic efforts of anthropologists like Bruce Albert, Gale Goodwin Gomez, Alcida Ramos, and Kenneth Taylor, among others. In Venezuela, where the situation was not as grave and urgent, basic research persisted. However, the controversy over the allegations of serious violations of professional ethics and of the human rights of the Yanomami on the part of Napoleon Chagnon and associates made in Patrick Tierney's controversial book in late 2000 have aroused increased concern with social responsibility and relevance in anthropological research in both Venezuela and Brazil. Accordingly, many no longer consider it justifiable to collect scientific data merely to feed careerism and the vague promise of contributing to human knowledge. Such egocentric work not only dehumanizes the host communities in which the research is conducted, but the researcher as well. The Yanomami and the profession deserve far better.

Fortunately, the Yanomami themselves are increasingly working to sustain their self-determination and other human rights, territorial integrity, and ethnic identity, as well as to meet their own medical, educational, political, and other needs. For instance, one of their leaders, Davi Kopenawa Yanomami, has traveled internationally to publicize their situation and needs. He has addressed organizations such as the British House of Commons and the United Nations. Some schools in Yanomami communities in Brazil are teaching computer literacy with equipment provided by donations raised by Cultural Survival, Inc. It may well be just a matter of time before there are even Yanomami trained as anthropologists documenting their own culture and critically assessing what others have published about their society. Thus, although Yanomami face many serious threats because of the failures of the state and provincial governments of Brazil and Venezuela in protecting and advancing their human rights, they are not merely passive victims of cultural contact and change, but increasingly active agents in struggling to determine their own future. The only anachronism is those racist and

ethnocentric outsiders who continue to view them as primitive, worthy only as a source of scientific data and not of voicing their own opinions—including opinions about anthropologists. The Yanomami are neither noble nor ignoble savages, but rather they are fellow human beings with a distinctive culture. Indeed, the word *Yanomami* simply means human being.

YERKES, ROBERT M. (1876–1956)

Robert Mearns Yerkes was an American psychobiologist who was among the most influential psychologists of the early 20th century. Although perhaps best known for his eugenic beliefs and role in the

Source: © Bettmann/CORBIS.

implementation of psychological tests for the United States Army in World War I, his most notable accomplishments were in nonhuman primate research. The Yerkes Primate Center is the world leader in research on great apes.

Yerkes was born on a farm outside of Breadsenville, Pennsylvania, and described this setting as ideal. During a childhood battle with scarlet fever, which claimed the life of his younger sister, Yerkes developed a close relationship with the family doctor and was inspired to enter a career in medicine. The support of his uncle allowed Yerkes to attend Ursinus College in Pennsylvania. From there, he entered Harvard University for a second bachelor's degree to help him prepare for graduate study. A suggestion by Josiah Royce, a philosophy professor and friend, was influential in Yerkes's decision to study comparative psychology. Yerkes completed his doctorate in 1902, and in 1905, married Ada Watterson. The couple had two children. Yerkes remained at Harvard teaching comparative psychology until World War I.

While teaching, Yerkes involved himself in research dealing with the learning abilities of animals. In 1911, he developed the first multiple-choice test for animals.

The test consisted of rows of boxes and was designed to test abstract abilities. During subsequent testing, the animal had to remember which boxes contained food. Yerkes also collaborated with many of his distinguished colleagues. With John B. Watson, Yerkes developed an instrument to test color vision in animals using monochromatic light. With John D. Dodson, Yerkes developed the Yerkes-Dodson Law. The law states that an optimum level of motivation exists for every task. A U-shaped curve illustrates the relationship between arousal and performance of mice in a test involving compartmented boxes. Yerkes and Dodson found that excessive levels of motivation could be a deterrent for completing certain tasks. Other early research projects included studies on turtles, kittens, frogs, and various invertebrates. Early texts published by Yerkes included a review of mutant mice characteristics, *The Dancing Mouse* (1907), and a textbook, *Introduction to Psychology* (1911).

Prior to World War I, Yerkes established himself as a leader in the study of human intelligence. In 1915, he revised the Stanford-Binet Intelligence scales that were designed to assess the cognitive and intellectual abilities of persons from age two to twenty-three. Yerkes was elected president of the American Psychological Association in 1916 and was chief of the Division of Psychology under the office of the United States Surgeon General in 1917.

A presidential proclamation in April 1917 involved Yerkes in the war effort. He became the chair of a committee charged with testing army recruits. A team of 40 psychologists including Henry Goddard, Lewis Ternman, and Walter Bingham worked under Yerkes, and together they developed the Army Alpha and Army Beta tests. The alpha test is a written measurement of intelligence, whereas the beta test is a pictorial test for the large numbers of illiterate recruits. Although not employed until late in the war, the tests were used to classify approximately 1.75 million men. Alpha test results were used to select the majority of commissioned war officers, as well as to discharge thousands of others deemed unfit to serve.

The army tests were a turning point for the developing field of human intelligence testing. Unlike the Stanford-Binet test, the alpha and beta tests could be administered to groups, decreasing the amount of time, personnel, and costs to the government. The widespread use of these tests led to the popularization of public and private sector testing. Over time, however, the tests became extremely controversial as

they were used to find (nonexistent) racial differences in intelligence. They were also used as proof of the supposed fall in overall intelligence of Americans.

Yerkes was against the idea of social Darwinism. Instead, he favored a eugenic view, believing that society could be improved through selective breeding for specific traits. His belief was solidified through studies of chimpanzee colonies at the Yale Laboratories.

Yerkes's fascination with nonhuman primates began when he was a graduate student. Throughout his time at Harvard, he took several steps to develop a facility where studies on great apes (chimpanzees, bonobos, gorillas, and orangutans) could be conducted. Yerkes's interest in primates led him to purchase chimpanzees for himself, as well as spend time studying them in California and Cuba. Together with the president of Yale University, James Rowland Angell, a plan was developed to begin an Institute of Psychology at Yale. With funding from the Rockefeller and Carnegie Foundations, the Yale Laboratories for Primate Biology opened in 1930 in Orange Park, Florida. The institution was later named the Yerkes National Primate Research Center and is currently at Emory University in Atlanta.

Yerkes Primate Center was the first to demonstrate that chimpanzees could be successfully bred and studied in captivity. Research conducted at the center included the social and sexual behavior of chimpanzees as well as their learning and intellectual abilities. Yerkes's primate research led to a dozen books including *Almost Human* (1925) and *Chimpanzees: A Laboratory Colony* (1943), as well as coauthored texts such as *Chimpanzee Intelligence and Its Vocal Expressions* (1925) with B.W. Learned and *The Great Apes* (1929) with his wife, Ada. Yerkes published his autobiography in 1930 and retired from Yale University in 1944.

Yerkes served as chairman of the Research Information Service of the National Research Council from 1919–1924. He was also head of the council's Commission on the Problems of Sex through 1947. In 1954, Yerkes was awarded the Gold Medal from the New York Zoological Society in recognition of his pioneering work in the field of psychobiology. He was a Fellow of the American Academy of Arts and Sciences, as well as a member of the National Academy of Science, the American Philosophical Society, the Society of Mammalogists, and the American Society of Naturalists, of which he was elected president in 1938. Although Robert Mearns

Yerkes died on February 3, 1956, at the age of 79, his contributions to the fields of animal behavior, learning, and cognition; captive breeding; intelligence testing; and psychology and psychobiology will live on for some time.

ROBERT M. YERKES

Psychologist Robert Yerkes is usually associated with his work on nonhuman primates, which has extensively expanded the field of biological anthropology. In 1930, Yerkes established the Yale Laboratories of Primate Biology, which was renamed the Yerkes Laboratory of Primate Biology. In 2002, the National Institute of Health designated Yerkes as one of eight national research centers on primates.

Whereas Yerkes's work as a primatologist has been well documented, his work in the field of intelligence testing is less well known. While serving as president of the American Psychological Association, Yerkes was asked to develop an intelligence test to classify army recruits during World War I. The Committee on the Psychological Examination of Recruits, which also included Lewis Terman (1877–1956), a pioneer in the field of intelligence testing, developed a test that was ultimately administered to 2 million army recruits, assigning them to A, B, C, D, and E groups.

Although the army intelligence test was criticized by those who doubted its validity and by those who argued that it was undemocratic, the work of Yerkes and his colleagues spawned a new industry. Intelligence testing spread to businesses that used the tests in hiring, promoting, and transferring employees. The American education system employed intelligence testing as a means of tracking students, placing them in groups of students with similar abilities. Proponents of eugenics seized on intelligence testing as a way to “prove” the inability of certain individuals to perform at what was considered “normal” levels. Armed with test results, eugenics advocates argued that such individuals should not be allowed to reproduce because of potential harm to the human race.

In 1921, a scholarly survey determined that definitions of intelligence should encompass the areas of higher-level abilities, the ability to learn, and the ability to adapt to environmental changes. By 1986, intelligence scholars had refined the definition of intelligence to focus on the ability to adapt to desired cultural values. Since the 1980s, the field of intelligence testing has grown rapidly with new tests being developed and existing tests being revamped to examine particular aspects of intelligence such as verbal and spatial abilities, inductive reasoning, and memory. The most commonly used tests are the Wechsler Intelligence Scale for Children, the Stanford-Binet Intelligence Scale, and Kaufman's Assessment Battery for Children. Intelligence tests now offer clinicians and educators a variety of testing methods to design treatment and programs based on particular needs. Critics of

new intelligence testing methods argue that although intelligence testing has expanded in quantity, the quality of the tests has not been measurably improved.

— Elizabeth Purdy

Yeti is the mysterious giant bipedal creature of the eternal snows of the Himalayas.

The yeti (*yeh-teh*) has always been a part of the cosmology of Lamaistic Buddhist peoples of the Himalayas, who class it as not quite human yet more than human, and keep relics of it in monasteries. As early as the 1830s, “westerners” in Nepal began to bring back tales of the creature under the name “Abominable Snowman,” but it was not until 1951 that these really achieved international fame with the publication of a photograph by two mountaineers, Eric Shipton and Michael Ward, of a footprint in the snow, taken on the Menlung Glacier at 5,500 meters (18,000 feet). The footprint was about 50 cm long and 33 cm wide, with a large hallux and second toe, and three small side toes; and a second photo showed a whole trail of footprints leading into the distance.

In 1958 a Texas oilman, Tom Slick, obtained the mummified hand of a yeti in a monastery in Nepal and smuggled it out of the country. Two years later, Edmund Hillary, the “conqueror of Everest” in the 1953 expedition, was permitted to borrow a scalp from a monastery for scientific investigation. Other relics were examined in Himalayan locales but not taken for study.

There are similar beliefs in giant hairy bipeds in mountainous regions elsewhere, such as the *almasty* of the Caucasus, *almas* of Mongolia, *yeren* of Sichuan, and *sasquatch* (“Bigfoot”) of western North America. The Russian cryptozoologist Boris Porschnev argued that many of them are surviving Neandertals, whereas the American anthropologist Grover Krantz favored the explanation that Bigfoot and yeti, at least, are relict populations of *Gigantopithecus*. There is also a dwarf hairy biped, *orang pendek* (literally “short person”), in Sumatra.

It would be nice to be able to report that at least one of these creatures had been discovered and classified. Alas. The Slick “hand” proved to be the paw of a snow leopard (*Panthera uncia*); the Hillary “scalp” was the shoulder skin of a serow (*Capricornis sumatraensis*). Even the Shipton–Ward footprint photos are in question. Ward later admitted that the trail (in the second photo) was not associated with famous single footprint, but was from a yak. A journalist, Peter Gillman, discovered that Shipton had a reputation as a hoaxer, and noted that the footprint in the photo had incongruities, indicating that it had been “improved.” The one item that is still arguable is a film of a “Bigfoot” taken in 1967 by Roger Patterson and Bob Gimlin in northern California. Some have declared the film authentic, others that it is a hoax; the speed at which the film was shot is unknown, which has not helped. There is even a claim, by Hollywood director John Landis, that it was someone wearing one of the gorilla suits made by John Chambers for the original (1968) film of *Planet of the Apes*.

At the moment it does not appear that there is acceptable evidence for the existence of yeti and friends, though there are still plenty of earnest seekers for it. It is especially unfortunate that any reality that may be behind the stories has tended to get buried under a mass of forgery.

— Colin Groves

Y-STR DNA

Y-STR is a relatively new term for geneticists, becoming common in DNA literature in the second half of the 1990s. The Y stands for the male chromosome, which, as a reproducing cell, does not recombine. STR is an abbreviation for short tandem repeat. Compared to other polymorphisms (different forms of the same trait), STR refers to faster-mutating polymorphisms such as microsatellites.

For an unknown reason, short sequences of DNA repeat themselves, with the number of repeats varying. The analysis of diverse polymorphisms with different rates of mutation and different numbers of repeats allows analysis of nonrecombining parts of the

Y chromosome. This has helped provide more knowledge of human evolution of males just as mtDNA analysis provides knowledge about female evolution.

Analysis of the Y chromosome has grown dramatically in recent years, along with a large increase in the number of polymorphic markers (an identifiable piece of DNA) available for analysis. There are now about 150 Y-STR loci that may provide analytical information, although only a small number is usually used because of economic reasons.

The use of polymorphisms for genetic analysis became available after Kary Mullis, in 1983, discovered the way to get a very small section of DNA containing a gene or a fragment from a genome to reproduce itself exponentially, thus being able to provide a sufficient amount of DNA for analysis. Mullis received a Nobel Prize in Chemistry in 1993 for developing this method, the polymerase chain reaction (PCR).

From an academic perspective, geneticists and anthropologists have applied this new knowledge to study the origin, dispersal, and distribution of modern humans, the sequential settlement of Polynesia, and numerous other similar topics. From an applied perspective, forensics and genealogy have become major areas of research. The technique for forensic DNA fingerprinting was introduced in 1984 by Alex Jeffreys. For both forensic and genealogical research, a number of positions (markers) on the DNA chain are tested, and a number is provided for each marker on the basis of the number of STRs. A list of numbers is referred to as a *haplotype*, regardless of the number of markers used. The more markers two men share, usually the closer they relate genetically.

Forensics frequently has used only six markers, which generally means that only one man out of every one million men randomly chosen will have a specific haplotype. The selection is similar in principle to most lottery drawings. This technique is especially good for excluding some suspects. However, most geographical areas do not have a random distribution of haplotypes, so there has been a push to increase the number of markers used. In genealogical research, a much larger number of markers is used. There is a nine-marker Y-STR database, maintained by the Institute of Legal Medicine in Berlin that, near the end of 2004, had more than 26,000 male DNA samples from more than two hundred sites in different parts of the world. Commercial companies now test men for their haplotypes, for genealogical purposes. In the United States,

the largest firm is Family Tree DNA in Houston, Texas, which tests 37 markers.

ZAFARRAYA CAVE

Zafarraya is a Mousterian site located within the El Boquete de Zafarraya (The Zafarraya Pass) of the Sierra Tejeda Mountains in the northeastern portion of the Malagá province of southern Spain, near the border of the town of Alcaucin. Five layers of archaeological material typed to the Mousterian were identified during initial excavations (1980–1983) by Cecilio Barroso-Ruiz and P. Medina Lara. An expanded excavation of the site by Barroso-Ruiz and Jean-Jacques Hublin in 1992 provided human and faunal remains, as well as typical Mousterian artifacts characterized by classic Levallois techniques. Hominid material recovered from the site includes one nearly complete mandible as well as isolated teeth and postcranial fragments. Zafarraya is notable for its secure dating of Neandertal occupation to approximately 33 kya—and likely occupation as late as 27 kyr—providing an example of one of the latest known surviving Neandertal populations.

The most diagnostic specimen from the site is a nearly complete mandible (specimen no. 8698). This specimen has a number of features similar to other late surviving Neandertals. Some notable features include teeth that are small in relation to the height of the mandibular corpus, anterior teeth that are large in relation to the postcanine teeth, a vertical symphysis with a mental trigone and moderate mental eminence, mental foramina positioned under P4, a retromolar space, and a relatively broad ascending ramus. Additional material excavated at the site include a second, burnt mandible, a partial femur, a partial innominate, and isolated teeth. Except for isolated teeth discovered in the upper levels, the hominid material was discovered in association with a hearth

on the lowest deposits in the cave. This material also shows varying degrees of Neandertal affinity, though several features of the partial femur and innominate may link the material to later Upper Paleolithic modern humans, possibly providing evidence of continuity with later European populations.

The archaeological and faunal material from the site reveal several important features. Approximately 90% of the faunal material recovered are identified as *Capra ibex pyreneica*, a local subspecies of goat, which may indicate specialized hunting or scavenging. However, predator fauna has also been recovered, so these predators may largely be responsible for collecting the material. No detailed taphonomic report has been published on the material. The faunal material is also important in dating the site. Bone samples were used in radiocarbon tests, and teeth samples were used in uranium-series dating. Teeth directly associated with the Neandertal remains in the lower level gives a thorium-uranium (Th/U) date of 33,400 years ago, material from the upper level gives a radiocarbon date of 29,800 B.P. and a Th/U date of 27,000 B.P., and material from the middle level gives a radiocarbon date of 31,800 and Th/U date of 31,700 years ago. These dates confirm that Zafarraya is one of the latest surviving Neandertal sites currently known.

The lithic material discovered from all layers is distinctly Mousterian, indicating that the population exploiting the cave may not have been exposed to more advanced Neandertal or anatomically modern human Upper Paleolithic blade technologies that were in use across much of Europe at the time. Zafarraya is one of a number of late surviving Neandertal sites located on the Iberian Peninsula that lack any Upper Paleolithic materials. The persistence of Neandertal populations in this area exhibiting a lack of Châtelperronian or early technologies, as well as the lack of early modern

human sites in the area, led to the development of the *Ebro Frontier model*. This model states that the Ebro river basin in northern Spain acted as a biogeographical barrier to the spread of technologies and peoples into the Iberian, allowing the late survival of distinct Neandertal populations.

The Zafarraya site is significant as a representative of one of the latest securely dated Neandertal occupations, and represents one of the best-known sites in the cul-de-sac of Iberia, which may have been the last holdout for the European Neandertals.

The Zande (or Azande, using the Zande plural prefix *a-*) are popular in anthropological literature thanks to the works of prominent British ethnographer, E. E. Evans-Pritchard. They are well known for the brilliant political success of their noble clans, their Trickster tales, their music, and especially for their beliefs in witchcraft, magic, and oracles.

The Zande live along the Nile-Congo watershed in the very center of Africa. Numbering between 500,000 and 800,000, they live in the three modern-day countries of Congo (ex-Zaire), Sudan, and Central African Republic. Most of Zandeland is rolling savanna crossed with streams along which

dense forests grow. The year is broken up into a summer dry season and a winter rainy season with the constantly warm temperatures to be expected just a few degrees north of the equator.

The Zande practice shifting agriculture; the main crops are eleusine millet, sweet potatoes, cassava, peanuts, squash, and various greens. Families work garden plots within a few miles of their village. They also hunt, fish, and collect termites, fruit, yams, and other wild foods. The typical Zande meal is a very consistent porridge made of either millet or cassava, served with meat or vegetable sauce. Millet or cassava beer is popular and plays an important role in ceremonial feasts and rituals.

Families used to live in scattered homesteads grouped loosely around a prince's court. Today however, as a result of colonial edicts, villages have been located along roads and market towns have sprung up at the old courts of kings. Clan membership passes through the father's line, and although it has become rare since the arrival of European and American missionaries, polygyny was common. Each wife had her own hut in a common courtyard. Bridewealth—ceremonial spears in the past, money or domestic goods today—seals the marriage contract.

Politics

In the early 1700s, two noble clans began consolidating political power and expanding into new territories, resulting in about a dozen kingdoms. A kingdom consisted of a royal court, ruled by a Vungara or Bandia king, who then sent his sons or loyal commoners to serve as governors of his provinces.

The Zande-speaking Vungara clan originated near modern-day Rafai (along the Chinko river) and expanded eastward, slowly assimilating neighboring groups, who then adopted Zande language and customs. In his book *Azande History and Political Institutions*, Evans-Pritchard argues that the Vungara were able to take political advantage of the surplus resulting from the recent development of agriculture. The Vungara kings and princes, by using permanent battalions of young warriors and the temporary labor of adult men to work their fields, and also by receiving tribute from the surrounding area, were able to control a very large amount of food, which they then redistributed in a way that strengthened their authority. The Vungara courts assured stability, military protection, and justice for peoples that until then had

been small-scale, autonomous groups. Food was given generously to feed the courtiers, the battalions and their leaders, and commoners who came to the court for redress of wrongs or with requests. Perhaps most importantly, the kings gave bridewealth (in the form of marriage spears) to anyone who asked. They also gave wives to loyal governors, military leaders, and others who had shown them great service or loyalty. The Vungara thus established a political stronghold in the region by being strong but also by being generous. The rulers and subjects benefited mutually: The Vungara depended on their subjects for warriors, labor, and tribute; the subjects in turn benefited from their generosity, protection, and courts of justice. It was this system that allowed the Vungara to evolve to a ruling clan, and to bring social hierarchy to peoples who until then had been small, autonomous, egalitarian groups. Wars were fought not so much to expand territory as to gain subjects, who would then contribute to building up the kingdom. The Vungara kingdoms, which included peoples of various ethnic groups, were very unstable, and a 20-year period saw a new set of kingdoms; the Vungara princes, especially in the newer, easternmost regions, were each other's worst enemy.

At about the same time, and in the same way, the Ngbandi-speaking Bandia clan migrated north from south of the Uele River and formed the kingdoms of Bangassou, Rafai, and Hilou in western Zandeland; the Bandia rulers adopted the language and customs of the Zande- and Nzakara-speakers they ruled. Eric de Dampierre underscores the effective use of the traditional system of kinship and alliance by the Bandia. The Bandia were foreigners and needed to get into the good graces of the local Nzakara and Zande population. They did this by supplying wives not to their relatives but to their subjects. Women went from being exchanged by lineage elders to being distributed by Bandia rulers. By controlling the circulation of women, the Bandia developed clienteles at the expense of the traditional, egalitarian lineage system. Gradually, allegiance replaced alliance. Residence was no longer based on kin groupings, but on client groupings. Unlike the Vungara kingdoms, the Bandia kingdoms in western Zandeland were very stable. Annual wars were fought not to expand territory or to incorporate more subjects into the kingdoms, but to bring back women and girls to give away as wives to subjects as they pleased.

Zande (and Nzakara) kings maintained standing armies and received Arab traders and European

explorers at their royal courts, which were social and political centers of a blossoming Zande civilization, complete with bodyguards, courtiers, and harp-playing minstrels. The more-or-less simultaneous arrival of Belgian, French, and British colonizers at the end of the 19th century disrupted the dynamics of the kingdoms. As treaties were signed (and a few Vungara kings forcefully deposed), European military officers, administrators, and traders penetrated Zandeland, and were soon followed by Christian missionaries. Colonial governments undermined the authority of the royal clans by allowing dissatisfied subjects to apply to European-style courts for redress and by putting a halt to military expeditions. The Vungara expansion was halted, and the Bandia were no longer able to distribute women as needed to maintain their authority.

Belief System

Evans-Pritchard's book *Witchcraft, Oracles, and Magic Among the Azande* (1937) is a classic in and outside of anthropology. Zande beliefs in witchcraft have often been used as an example of primitive beliefs. Evans-Pritchard's use of the terms *witchcraft*, *magic*, and *sorcery*, based on the Zande concepts, has been widely followed by other anthropologists.

The Zande believe that illness, death, and other misfortunes are usually due to the ill will of a fellow human rather than coincidence or bad luck. For the Zande, two types of causes merge to cause misfortune. The *sensitive* cause is visible, and is on the level of common sense; the *mystical* cause is invisible and explains why a particular person suffered a particular misfortune in a particular place at a particular time. For example, if a buffalo gores a man, the sensitive cause is the buffalo, and Zande will agree that the victim died because a buffalo gores him. But the buffalo would not have killed the man if a mystical cause had not put him in its path.

Witchcraft (*mangu*) is the most common mystical cause. Witchcraft is an inherited organic substance in the abdomen of some men and women that is awakened by greed, jealousy, spite, and other such emotions. Typical consequences of witchcraft are crop failure, unsuccessful hunting, a house fire, a hunting accident, illness, and death. If a misfortune occurs, especially if it is ongoing, the victim's family seeks out the witch in order to have him or her withdraw, or "cool" the witchcraft. They do this through oracles, which are objects that give yes-no answers to questions

posed. The most effective oracle was a poison used on chickens; the oracle operator would drop a few drops of poison into its mouth while asking a yes–no question about the alleged witch. If the chicken died, the answer was “yes”; if it lived, the answer was “no,” according to how the question was phrased. The termite oracle calls for two branches to be inserted into a termite mound overnight. If the branch on the left comes out cleaner than the one on the right, the answer is “yes,” and vice-versa. Once the oracle reveals the witch, the family presents its accusation. A man or woman accused of witchcraft generally claims innocence, takes a sip of water and blows it out, and states that if it were his or her witchcraft which was causing the illness, the organ would now remain cool and the harmful influence would end. Zande are less interested in finding out who among them is a witch than finding the witchcraft responsible for ongoing illness or bad luck.

Another mystical cause that can trigger misfortune is magic. The Zande word *ngua* has several English translations: plant, tree, stick, wood, medicine, drug, poison, and magic. The Zande can name over three hundred plant varieties, most of which are used to make medicines for common aches and illnesses. They make no distinction between a plant’s “real” versus “magical” effects. Plants are used in a more magical sense to protect property (such as to protect a house from burglary during its owner’s absence), for good luck while hunting, and to ensure good health (by protecting from witchcraft). The Zande believe that some people also use plants to cause illness or misfortune. It is this harmful magic or sorcery that, along with witchcraft, is cited as a cause of death and misfortune. It seems probable that magic has long been increasing in variety and in importance among the Zande, and that “bad magic,” in particular, is relatively new. Closed magic associations, or *secret societies*, proliferated in Zandeland at the turn of the last century; they were not condoned by the noble clans, and they were declared illegal by colonial governments. Furthermore, while, in the past, a witch guilty of murder was executed or made to pay compensation, it became the rule to use vengeance magic to kill a witch who has caused the death of a kinsman.

Witch doctors (*abinza*) were men (and, exceptionally, women) who, through plants, acquired the power to discern witchcraft. Those who desired to become witch doctors went through a long apprenticeship in which they learned which plants to eat and how to

prepare them properly. At the request of a head of household, two or more witch doctors would hold a public *séance* to clear the air of witchcraft. By dancing the wild *avure* dance to frenzied drumming, they were able to see witchcraft. Witch doctors prophesied and made revelations about witchcraft, but they were not considered as reliable as the poison or termite oracles. It could therefore be said that witch doctors had a greater role in collectively stymieing and reducing the threat of witchcraft than in revealing or punishing actual cases of witchcraft. Oracles and magic are private acts, and must be kept hidden from others, lest witchcraft interfere with their efficacy. Witch doctors, on the contrary, held their *séances* in public, before crowds, actively seeking out witchcraft in order to thwart it, and were not at all threatened by it. Thus, a unique function of theirs was to publicly acknowledge the existence of witchcraft and actively fight against it.

The ancestors, too, influence the lives of the living. Long after a person dies, when no one alive remembers him or her, the soul merges with a collectivity of ancestors’ souls called *atoro*. They are often blamed for such misfortunes as epidemics or droughts, which affect the whole village rather than individuals who may have inspired ill will in a neighbor who happened to be a witch. Most families have a sort of altar (*tuka*) to the ancestors where they make offerings, such as the first fruits of harvest, to keep the ancestors appeased.

Finally, there is a Zande word, *mbori*, for a supreme being or power. Evans-Pritchard argued (and more recent research concurs) that the term only recently came to refer to a supreme being akin to the Christian God, and that “Fate” might have been a better translation for the term than “God.” *Mbori* is very common in Zande names, such as *Mboriundare*, which could be translated as “Fate be good to me” or “God help me,” depending on the translator. If no other mystical cause for misfortune or death can be found, and especially in the case of the death of an elderly man or woman, the Zande may simply say it was *mbori* who decided it was that person’s time to die; in other words, it was fate, or it was God’s will.

Trickster Tales

The Zande are veritable oral artists. Their tales, songs, proverbs, and daily rhetoric reveal enjoyment of language, incredible improvisational skill, and cleverness in using metaphorical allusions and double entendres.

The largest category of “oral literature” is *sangba-ture*, or tales of the Trickster. There are hundreds of versions of the tales, although most storytellers use the same few dozen episodes, weaving them together differently at each telling. The hero’s name is Ture, which literally means “spider,” and he has been called a Trickster because of his cleverness mixed with gluttony and a penchant for getting himself into trouble, often with hilarious consequences. The Trickster tales are actually *chanteables*, or narrative mixed with song. The Trickster tales are generally not etiological (that is, they do not explain why something is the way it is), nor are they moral lessons. They are told only in the evening, and include ritualized openings and endings. There is never any mention of witchcraft in the tales; and although magic abounds, it is not typical Zande magic (for protection or vengeance), but instead magical means to accomplish extraordinary feats.

A second category of tales is *pa-anya*, or animal fables, which differ from Trickster tales by their length (they are very short), the absence of Ture, the absence of song, and their etiological bent. Animal fables explain some feature of the animal world, such as why ants and termites fight each other, why leopards have spots, or why monkeys live in trees.

Finally, one of the most impressive verbal arts of the Zande is their use of hundreds of proverbs (*sanza*), which have literal meanings but also hidden meanings that vary according to the speaker and the situation. The Zande use this roundabout way of speaking through proverbs to insult, criticize, tease, or accuse, which they can then later deny doing. This is especially important in a society in which offensive remarks can result in witchcraft. Many of the proverbs refer to animals and show the Zande’s intimate knowledge of wildlife.

Music

The Zande are expert musicians, both instrumental and vocal. The Zande five-string harp (*kundi*) is world-renowned; it uses a pentatonic scale and often features a beautifully sculpted head on the end of the bow. The harpist plays intricate rhythms while simultaneously and ingeniously improvising words to a song. The songs are extremely poetic; in fact, harp-players should actually be called poets who accompany their poems with their instrument. Harpists were common at the courts of kings and princes, the

equivalent of minstrels in European royal courts. But since the demise of the kingdoms and the courts, the harp has lost its popularity in favor of the more dance-oriented xylophone.

The Zapotec are an ethnic group that has long inhabited modern Oaxaca in Mexico. The ancient Zapotec produced one of Mesoamerica’s earliest civilizations, replete with cities, monumental architecture, writing and calendrical systems, accomplished artisans, complex sociopolitical organization, and far-reaching economic ties. Contemporary Zapotec peoples refer to their ancestors as *binni gula’sa*’ (or *Ben ‘Zaa*), the Cloud People, and in doing so stress the vibrant role of the past in their present-day lives. Similarly, *binni sa*, or *binni za*, which translates as “the type of people we are,” is also used. This term offers a desirable alternative to *Zapotec*, which is a Nahuatl-derived word and thus an externally imposed category.

Predicated upon linguistic evidence, scholars have argued that the Zapotec and Mixtec, another ethnic group of Mexico, split from one another as early as 3700 BC. By approximately 1500 BC, the Zapotec most likely occupied areas in present-day Oaxaca. The fertile Valley of Oaxaca long served as the heartland of Zapotec civilization. Communities were established throughout the valley’s three arms, the best-known being San Jose Mogote and Tierras Largas in the Etla subvalley. At the end of the Rosario phase (ca. 700–500 BC), settlement in the valley’s arms dramatically declined. This decline coincides with initial occupation of Monte Albán. Scholars have

argued that the center, which would become the Zapotec capital, was established by a confederation of elites. Cultural elements and material remains distinguishable as ethnically Zapotec crystallized between 400 BC and AD 100.

Monte Albán is situated atop a 400-meter mountain at the junction of the Oaxaca Valley's three arms. There is no known natural source of water, suggesting that the location was selected as a consequence of physical centrality, political strategy, and military defense. The center's inhabitants carved agricultural and domestic terraces from the mountain's slope, and they leveled its top. To meet the growing center's sustenance demands, Monte Albán's inhabitants developed the surrounding piedmont via intensive canal irrigation. By the Monte Albán II period (ca. 200 BC–AD 100), an administrative hierarchy, palace structures, royal tombs, and monuments depicting conquest were all in evidence at the center. It is this last attribute that informs our understanding of the methods used to consolidate the Oaxaca Valley. The emergence of the Zapotec state appears to have been wedded with violence. Architecture and iconography at Monte Albán underscore the need for defense and success in conquest. Fortifications ring the hilltop city, and stone slabs carved with naked, mutilated, and slain individuals adorn the eastern wall of Building L. These images were originally identified as *danzantes* (dancers), and most likely represent prisoners, who were of Zapotec ethnicity, captured during military campaigns. Such evidence suggests that, even in antiquity, the Zapotec were by no means a unified ethnic group.

During this time, Zapotec influence reached beyond the borders of the valley's three arms. A Zapotec presence at the central Mexican site of Teotihuacán is particularly noteworthy. Ceramic wares and tombs in Monte Albán styles suggest that the Zapotec had established an Oaxaca Barrio, and maintained a politically autonomous and amicable relationship with Teotihuacáños. Such amicability does not seem to characterize interactions between the Zapotecs and other foreigners. Iconography associated with Building J at Monte Albán provides evidence of these aggressive interactions. "Conquest slabs," carved with place glyphs and inverted human heads, were inset into the external façade of the building. Scholars have argued that these images represent foreign communities conquered or colonized by the Zapotec.

By AD 800, authority held by the Zapotecs of Monte Albán had waned, as did the city's population numbers. Elsewhere in the Oaxaca Valley, other Zapotec centers increased in importance and size, such as Zaachila and Mitla. Joyce Marcus has noted that during this period the Zapotec experienced a shift from political centralization to balkanization, in which power was divided amongst numerous, competing centers. By the Postclassic period (ca. AD 1000), defensive response and not offensive strategizing characterized military force, as the Zapotec resisted political expansion by first the Mixtec and later the Mexica (more commonly known as the Aztec).

At the time of Spanish Conquest in 1519, political and linguistic fragmentation between the different Zapotec groups of the highlands, the valley, the coast, and the isthmus had occurred. European conquerors and chroniclers, however, treated diverse native peoples as a homogenous ethnic group—*indios*—in their policies and literary descriptions. In 1528, King Carlos V bestowed upon Hernán Cortés, famed conqueror of Mexico, an *encomienda* that encompassed large portions of the Oaxaca Valley and the Isthmus of Tehuantepec. As Marquesado del Valle, Cortés controlled these lands' resources, including its indigenous labor pool. In the colonial aftermath, forced servitude and—more prominently—the spread of Old World disease for which native peoples had no natural immunity dramatically reduced the number of Zapotec peoples. Moreover, Dominican missionaries were strongly opposed to the Zapotec's animistic religious practices. In particular, Zapotec rituals invoked the spirits of deceased ancestors, paid respect to supernatural beings like Lightning (*Cociyo*) and Clouds (*Zaa*), imbued all animate objects with the vital force *pée* ("wind," "breath," or "spirit"), and sanctified natural landscape features like caves and mountains.

Despite population loss and forced conversion to Christianity, the Zapotec did not succumb easily to European dominance. Through the centuries, numerous resistance movements flourished as Zapotecs from distinct regions unified. This resistance was at times overtly violent, as well as more covert in that the Zapotec continued with religious practices deemed idolatrous and forbidden by the Church. Zapotec identity was maintained within villages, which were composed primarily of peasants and characterized by their isolation and conservative attitudes. These communities actively and effectively

opposed colonizers' political and socioeconomic changes. Subsistence strategies continued to include fishing, hunting, small-scale agriculture, maize cultivation, and salt collecting, and artisans persisted in their production of native crafts. Modernization and capitalism, which significantly restructured sociopolitical organization and economic structures, has not dampened ethnic solidarity. Rather, by drawing on components of Zapotec identity, represented as ancient and long-standing, politicians and intellectuals have been active in implementing social change and reviving cultural practices. Indeed for contemporary Zapotec peoples, the past is power.

ZIGGURATS

A common feature in ancient Mesopotamian cities, a ziggurat was a square or rectilinear terraced platform with a temple at its summit. A stairway or ramp led from the ziggurat's base to the temple, the residence of the city's patron deity. Ziggurats vary in form and style; some of the largest and best-understood ziggurats have been excavated at Aššur, Babylon, Eridu, Nippur, Ur, and Uruk in modern Iraq. Genesis 11: 1–9 figuratively describes the construction of the Tower of Babel, widely believed to be the ziggurat of Babylon, called Etemenanki, “the house of heaven and earth's foundation.”

Large and well-organized teams of workers were required to lay the ziggurat's mudbricks that made up its core. Buttresses dressed the ziggurat's exterior, adding structural support and a decorative element. Drainage systems built into the ziggurat countered the deteriorating effects of rainfall on mudbrick. The ziggurat was a palimpsest of earlier building versions that were incorporated within the most recent innovation; archaeologists who excavate ziggurats work to reconstruct the buildings' multiple construction phases.

Although platformed ziggurats first appeared in the fifth millennium BCE, classic terraced ziggurats were constructed in major Mesopotamian cities starting in the late third millennium. In general, ziggurats are separated into southern “Babylonian” and northern

“Assyrian” regional styles. The earlier southern style displayed a rectilinear foundation oriented along the cardinal points and a series of staircases leading up and around the structure to the shrine. The later northern style exhibited square foundations whose corners were often not aligned according to the cardinal points. Northern ziggurats were incorporated into triple-platformed temple complexes. Typically, a ramp led to a courtyard on the first platform, a temple on the second, and, finally, the ziggurat on the final platform. Examples of the southern tradition were constructed at Ur, Uruk, and Nippur, whereas northern traditions were found at Khorsabad, Aššur, and Tell er-Rimah.

Despite the variability in regional form, the ziggurat's function was reserved for religious purposes. The city's patron god or gods lived in the temples where attendants cared for them and oversaw the temple's daily operations. Mesopotamian kings saw the construction and repair of ziggurats as their divine right to exercise, calling on their constituents to dedicate time and resources to the building. The ziggurat remains a symbol of Mesopotamian architectural achievement and a measure of Mesopotamian society's dedication to its religion.

ZINJANTHROPUS BOISEI

Zinjanthropus is an extinct hominin discovered by Mary Leakey in 1959 at Olduvai Gorge, Tanzania. The name *Zinjanthropus* literally means “East African Man.” The specimen for which the species *Zinjanthropus boisei* was named (OH5, or Olduvai Hominid 5) is also

known as “Nutcracker man” because of its extremely large postcanine teeth (molars and premolars). *Zinjanthropus boisei* was later reclassified as *Australopithecus boisei* (*A. boisei*) because of its similarities to South African robust australopithecines. Some scientists have advocated reclassifying it to the genus *Paranthropus*, a sister taxon to *Australopithecus*.

The fossil preserves a nearly complete cranium of an adult male. Its brain size is about 530 cubic centimeters (cc), which is larger than the average chimpanzee (390 cc) but much smaller than the average human (1400 cc). The most impressive aspects of this skull are the characters associated with its massive jaws and postcanine teeth. These teeth are nearly four times the size of those of modern humans, although the hominins themselves were much smaller. Associated with these large teeth are large jaws to house them. The skull presents a bony crest on the top for attaching large chewing muscles. In addition, it possesses wide cheekbones that flare out to allow the passage of these muscles. As a result the face is somewhat dished-out in profile. These adaptations to heavy chewing, together with tooth wear and chipping, have been interpreted as evidence that *A. boisei* was a specialized feeder with a diet composed mostly of hard, low-quality foods.

Since the original discovery of OH5, many more fossils of this species have been discovered. They are found primarily in Ethiopia, Tanzania, and Kenya in East Africa. The OH5 fossil has been dated to approximately 1.8 million years, but the species to which it belongs (*A. boisei*) spans 2.3 (from Omo, Ethiopia) to 1.2 million years (Olduvai Gorge, Tanzania). About 1.2 million years ago the species disappears from the fossil record. Many scientists believe their extinction is linked to overspecialization to a particular environment. They hypothesize that when the environment changed the species could not survive. However, recent analyses have suggested that, in fact, *A. boisei* (like *Homo habilis*) was a generalized feeder and that other explanations need to be invoked to explain their extinction.

The OH5 specimen was originally considered by Louis Leakey to represent a human ancestor. Later, after the discovery in 1960 of a less robust hominin also from Olduvai (*Homo habilis*), it was reassigned to an evolutionary side branch in human prehistory. Earlier, some scientists believed the East African *A. boisei* to be male representatives of the South African *A. robustus* (also a large-toothed hominin). When

both males and females of *A. boisei* were found in East Africa this hypothesis, known as the Single Species Hypothesis, was discarded. It is now accepted that more than one hominin species lived at the same time and there was great diversity in early hominin evolution. The exact evolutionary relationship between *A. boisei* and other early hominin species is still debated within paleoanthropology. However, most paleoanthropologists agree that *A. boisei* was an extinct hominin side branch that did not contribute to later human evolution.

ZOOARCHAEOLOGY

Zooarchaeology is the study of human beings and their relationship to nonhuman animals. Research in this area involves the analysis of animal remains (also called *faunal* remains or *archaeofauna*) from archaeological sites, such as bone from amphibians, mammals, reptiles, birds, and fish, and shellfish such as lobster and mollusks.

Animals have probably always played an important role in our biological and cultural development. Evidence from archaeological sites around the world demonstrate that animal resources such as meat, fat,

blood, marrow, and other edible parts were nutritionally important. Secondary products—fur, wool, hides, bones, teeth, and shells—provided materials that we used for clothing, shelter, and making tools.

As human populations grew, we became increasingly dependent on animals for companionship, protection, and work-related activities. Animals are well-known from cave paintings, hieroglyphics, and the archaeological record as being critical components in commerce and warfare. As this dependence grew, we domesticated many wild varieties of animals. This changed animals genetically, but, in addition, we selected certain artificial traits to, for example, increase milk or wool production. We also selected some behavioral changes. The wolf is a good case in point, as we consider it the ancestor of today's domesticated dog. It seems that, over the past 14,000 years, human beings have bred all of the current breeds of dog for a variety of tasks related to our endeavors and our lives.

Zooarchaeologists are interested in analyzing animals to examine

paleoenvironments and environmental change

the technologies or techniques that humans use to hunt or capture their prey

the nutritional values of animals

the origins of animal domestication

the development of animal breeds

how animals fit into the economic, social, and belief systems of ancient societies

the formation of archaeological sites (taphonomy) and associated archaeofaunal assemblages

Archaeofauna are often ideal for study because their remains can preserve well, even in sites dating back tens of thousands of years. Under special circumstances, bones and other tissues may become mineralized or preserved as fossils that date back millions of years. When investigated by trained archaeologists, these remains can provide vital clues to the past environment and how human beings may have interacted with animals or exploited them.

When faunal remains are discovered, zooarchaeologists usually proceed with identifying the particular animal to species if possible, their frequency within the assemblage, and whether there are some parts of the animal that preserves better than others (called

preservation bias). The zooarchaeologist will also want to measure the remains to help identify the animal to gender or taxa and determine if any changes were occurring over time, examine the bones for evidence of butchery, and—using chemical, genetic, or isotopic techniques—to discover evolutionary relationships and dietary preferences. In this way, archaeologists can better understand human-animal relationships over time.

A zoological garden is an establishment housing collections of both wild and domestic animals that are exhibited to the public. Zoos reflect the curiosity and intrigue of humankind toward our animal kingdom. Zoos also reflect our responsibility as a species to promote conservation through education and make an attempt to manage our globe by studying the species within. Modern trends include perfecting husbandry techniques for many exotic species and carefully managing captive breeding programs. A key focus of zoos is the breeding of endangered species in captivity, while meticulously managing their gene pools, functioning as a modern “Noah’s Ark.” Zoos are capable of sustaining viable populations of endangered species, even after the animals have disappeared from the wild.

The current trend in zoos is to display animals in simulated natural environments. This provides a more beneficial environment for the resident animals, while also immersing the public in many unique ecosystems, such as an African Savannah. Most large cities currently have zoological reserves, and many serve as centers of research for conservation and the study of exotic animals. Centers of research include London (Regents Park), New York City (The Bronx Zoo), San

Source: © iStockphoto/Kevin Tate.

Francisco (San Francisco Zoo), Paris (Jardin des Plantes, Jardin d'Acclimatation, and Bois de Boulogne), Honolulu (The Honolulu Zoo), Melbourne (Royal Melbourne Zoological Gardens), Rome (Zoological Garden of Rome), and Berlin (Tiergarten). A zoo can be a municipality owned by the city, privately owned, or managed by a nonprofit zoological society or a combination of several. For example, the Honolulu Zoo is owned by the City and County of Honolulu, but also has a nonprofit branch, the Honolulu Zoological Society, to assist its efforts in conservation and education.

The purpose of a zoo has many facets, including entertainment, education, conservation, research, and captive breeding programs. In the past, zoos were only looked at as a source of entertainment. The current focus of zoos has become much more complex. A zoo's responsibility is multifaceted, including research on rare and endangered species, conservation efforts on all continents, and education of the public to increase people's awareness of global issues and responsibilities. The American Association of Zoological Parks and Aquariums (AZA), founded in 1924, is the main accreditation body in North America and the Pacific. With 214 accredited institutions and more than 6,000 members, AZA supports the advancement of zoos and aquariums, holding zoos to high standards, as well as managing captive breeding programs. The AZA has the profound potential to promote and fund conservation and education efforts, benefiting both species and habitat conservation. The Honolulu Zoo is an

accredited AZA member, reflecting high zoological standards in its mission statement: "to foster an appreciation of our living world, with an emphasis on tropical ecosystems, by serving as a center for environmental education, biology study, and recreation and conservation activities."

The practice of keeping wild animals in captivity is an ancient idea. Stone tablets found in the Sumerian city of Ur, dated to around 2300 BC, document the establishment and management of the earliest

known animal park. In ancient Egypt, wild animals were regarded as objects of wealth, and were presented as gifts to the pharaohs. Around 1500 BC, the pharaoh Tuthmosis III (1501–1447 BC) imported many animals to Egypt and maintained his own collection. Queen Hatshephut, his stepmother, organized expeditions to capture wild animals. In 1490 BC, Queen Hatshephut sent an expedition to the coast of present-day Somalia, bringing back monkeys and exotic birds for the royal animal park.

The Greeks preferred wild birds to mammals. However, when the Greeks invaded India, they were greatly impressed by the elephants' capacity to be trained to work or fight, and they promptly drafted the elephant for war. Alexander the Great maintained collections of both African and Indian elephants, bears, monkeys, and other exotic animals, in tribute to the countries his army vanquished. In time, he established what was possibly the first public zoo. In the third century BC, Alexander joined Aristotle and began the first scientific studies of captive animals.

Up until the 19th century, little had changed in western zoos. Most zoos were still the privilege of the nobility and wealthy. Poor knowledge of animal husbandry and natural history led to poor living conditions and shortened lives for zoo animals. Animals were kept in zoos for human amusement and were symbols of power and status. The evolution of a more modern zoo began in France under the reign of Louis XIV at Versailles in 1664. He began to display animals arranged together in more natural groupings and

attended closely to their physical needs. His legacy continues through to today. After the French revolution, the collection was sent to the Jardin des Plantes, a botanical garden in Paris. This union created the Jardin des Plantes Zoological Gardens in 1793. The Jardin gained an international reputation as a place of science and knowledge, and prompted Sir Stamford Raffles and other British gentlemen to create a non-profit zoological collection in London. In 1826, the Zoological Society of London was created.

When Darwin set out on his voyage in 1837 on HMS *Beagle*, as the naturalist on the boat he collected a huge amount of specimens for the Zoological Society of London. The collection included birds from the Galapagos Islands, which Darwin first thought was a mismatch assembly of warblers, grosbeaks, orioles, and finches. Upon inspection by an ornithologist at the Zoological Society of London, the birds were determined to all be new species of finches. This astonishing find in part led Darwin to his theory of evolution. Our inquisitory nature has led us to capture and study the animals around us throughout history. As more and more species become endangered in the modern world, the living DNA found in our zoological institutions has become invaluable to conserving the genetic diversity of our world.

Today's zoos have the opportunity to play a vital role in the survival and maintenance of endangered species worldwide. Through captive breeding programs, rare animals can be brought back from the edge of extinction. Enormous improvements in enclosure design, appreciation and awareness of species natural history, and animal management techniques, have led to highly successful breeding rates for a variety of species. These high reproduction rates have led to a surplus of animals within the zoo system. Surplus animals create challenges in the use of space and resources and have led to a need to focus on breeding protocols. The goal of every captive breeding program is to maintain the genetic diversity of a species by coordinating all participating facilities to make beneficial reproductive decisions. Every captive breeding program has both a national and international studbook system that manages this task. The ISIS (International Species Information System) and the IZY (International Zoo Yearbook) are two databases used to manage captive stock.

Throughout history wild animals have been kept for human amusement and enjoyment. Zoos are a place where people can visit to satisfy their curiosity

and view specimens of an exotic nature. The past few decades have brought about a new responsibility for zoos. Human activity has considerably reduced the earth's biodiversity. Wide-scale pollution, human overpopulation, habitat destruction, and the unrestricted use of natural resources have led to the disappearance of many species.

Today zoos focus on the conservation of endangered animals and the education of the public in conservation and environmental issues. Each year the world's zoos are visited by hundreds of millions of people, from all areas of society and all ages. Many of the people who visit have little contact with nature, and zoos provide a means for all to experience the biodiversity of the planet. The main attraction will always be the wild animals. These exotic species are the hook that grabs the public's attention, and allows zoos to convey knowledge of pressing conservation issues to the public. With the support of the public, zoos can successfully fund their efforts and create change, whether it be purchasing acres for a sanctuary or raising money for game reserve management. Each small step does make a difference. The modern zoo is a repository of living DNA, a Noah's ark, and can in some cases have the capacity to actually turn back the tide of destruction.

Zoos have always been an important source of biological knowledge. They have been instrumental in the development of anatomy, morphology, classification, and natural history data. Research undertaken in zoos includes studies on animal behavior, veterinary medication, appropriate husbandry, and physiology of countless wild species. This knowledge benefits captive animals, and also provides a better understanding of wild populations.

Scientific study of animals is vital both in captive and wild settings. The knowledge obtained from wild research can help both the conservation and management of wild populations and the development of successful husbandry techniques. In return, zoos work with universities and colleges to carry out detailed studies that would be difficult to perform in wild settings. The zoo environment contains a vast array of knowledgeable collaborators, all focused on the successful management of species in captivity and the wild.

The greatest hope for species survival is through education. We need people to understand the global situation, not just what is in their back yard. Through education, the public can understand that there are massive interconnected changes happening in all

global ecosystems. Tropical rain forests are disappearing at an alarming rate, escalating global warming, which is in turn melting the icecaps in the Arctic and Antarctic. Every action has a consequence. Our forests are being destroyed at a phenomenal rate; we cannot continue to survive at our current rate of destruction. It is not hard to comprehend the real danger of mass extinction.

Every country has three forms of wealth: material, cultural, and biological. Biodiversity has the potential to produce new medicines and chemicals that can benefit all of humankind. Biodiversity also has the potential to produce profound amounts of money from ecotourism. Poor countries are finding that nature reserves and game parks can make more money than farmland. Societies must begin to invest in native species as a financial resource: not as food, but as a source of ecotourism, providing a profitable and sustainable resource. Ecotourism and biodiversity are the true hopes for the future, especially in developing countries. Zoos can assist local governments globally to replenish lost populations and promote conservation.

Zoos have to foster a sense of community, a sense of global interconnection, where we recognize and embrace our neighbors on other continents. We must acknowledge the diverse conservation issues that global societies face and focus on sustainable solutions. Zoos can set a precedent to aggressively manage what we have left. We can reach out in our own communities, and through the efforts of zoos, bring people together.

ZOOS

The nature of zoos changed dramatically over the course of the 19th and 20th centuries and the debate over their future still continues to excite contrasting passions. Zoos have been conceptualized as concrete expressions of lasting tensions between the wilderness and civilization, science and popular culture, education and entertainment. The recreational purpose of the early zoos has been complemented with the more respectable aims of preserving endangered species and promoting natural appreciation in visitors.

The urbanization of North America and Europe made zoos increasingly popular in the 18th and 19th centuries. Imperialism and scientific explorations brought a diversity of animal and plant specimens from distant and exotic regions, and industrial advances enabled the construction of elaborate enclosures. During the 20th century, zoos strove to attain the status of cultural institutions, and they progressively stressed ecological themes, thus leading to the exhibition of animals in more natural surroundings and a stronger emphasis on the role of conservation. Yet, in spite of these efforts to claim educational respectability and to promote their contributions to conservation, zoos are still perceived by large sectors of the public as a source of recreation and as animal displays. Rates of visitors to zoos continue to increase and zoo administrators argue that the pedagogical and recreational aims are not self-contradicting because, by getting people's attention through entertainment, zoos stimulate them to learn more.

Despite their stated noble aims, zoos have had their reputations challenged by a number of problematic issues. First among these arguments is the impact of zoos on the lives of their animals. Conservation may be a legitimate concern, yet critics argue that once an animal enters a zoo, it is effectively dead. Deprived of their ecological contexts, animals become mere carriers of DNA waiting to be copied. Reintroductions of species to the wild have been few in number and of limited success. In addition, the majority of animals in most zoos are not endangered and the choice of species to exhibit concentrates on large, fashionable

mammals. Considerable debate also continues to focus on the ethics of keeping wild animals in captivity and this has led to efforts to improve the animals' living conditions. Some zoos, such as Seattle's Woodland Park Zoo, have tried to raise their standards of living with the concept of "landscape immersion," where people and animals are surrounded by carefully replicated natural habitats. As David Hancocks suggests in his study *A Different Nature* (2002), zoos should move away from being mere warehouses of living creatures and educate people about natural systems, biodiversity, and the pressing need for the preservation of all species, not only the most beautiful or popular ones.

— Luca Prono

The largest Black ethnic group in South Africa is the Zulu, whose population stands at about nine million. The Zulu have a relatively brief history as an independent group. The term *Zulu* refers to the Nguni speaking people in KwaZulu Natal in South Africa. The Zulu are a branch of the southern Bantu, who have close ethnic, linguistic, and cultural ties with other groups in the area such as the Xhosa and the Swazi.

Although the Zulu are the largest Black ethnic group in South Africa, they are the least Christianized group there. That did not keep the Zulu from using millenarian Christian rhetoric to advance their cause: Chief Mangosuthu Buthelezi's Inkatha Freedom Party's campaign slogan during the 1994 democratic election was "The last shall be first." Buthelezi thus claimed a sacred origin for Zulu nationalism, freely using Christian terms promising a divine destiny.

Buthelezi's slogan is in the Zulu tradition of using religion to strengthen Zulu nationalistic objectives. The rise of the Zulu and their consolidation of power and resistance to British power and later to other ethnic groups in the New South Africa follow a common pattern of the union of religious ideas with nationalistic ones. This pattern forms the outline of this article.

History

Early Period

In the early 19th century, the Nguni, under Shaka, united the Zulu clan of the Nguni with other Nguni people in Natal, forming the Zulu nation. Shaka used his clan name, Zulu, for the united peoples. Through expansive conquest and use of new principles of warfare, Shaka formed the powerful Zulu Empire.

Shaka was born about 1787 to the Zulu clan of the Nguni, and his father was a Zulu chieftain. Shaka had a turbulent childhood. His parents split up when he was about 6 years old. When he was around 15, his mother's people, the Langeni clan, drove him and his mother out. They found refuge with the Dietsheni clan. This clan belonged to the Mtetwa people, a very powerful group. Shaka stayed with the Mtetwa as a warrior until his father died in 1816 and he became the Zulu chief.

It was at this time that Shaka showed his military skill. He reorganized the military in such a way as to change warfare from a series of skirmishes into a bloody ordeal. Swords replaced spears, leading to close-quarter fighting. Shaka developed new tactics: He divided the army into four parts and trained each unit to surround the enemy. In a brief time, he had built up his Empire.

Historically, the Zulu were farmers who kept large herds of cattle. They kept up the size of these herds through cattle raids. During the 19th century, European settlers fought the Zulu, taking grazing and water resources from them. The Zulu had little option but to hire themselves out for labor on European farms or in urban areas. Shaka's heirs had little time to enjoy the fruits of their conquest. They found themselves battling with Boer settlers migrating north into Natal. These Boers, Dutch descendants who were farmers, were moving away from British settlers and their government, a movement called The Great Trek. Dingane, the Zulu chief, ambushed Boers moving through his territory, killing around 500 people. This massacre occurred in 1838. Andries Pretorius, a Boer general, retaliated at the Battle of Blood River, killing about 3,000 Zulus. In 1840, the Boer intruded into Zulu domestic politics, resulting in the toppling of Dingane and the rise to power of Mpande, who became a vassal of the Boer republic of Natal.

Anglo-Zulu Wars

When the British succeeded the Boers as rulers of Natal in 1843, they found Mpande's son, Cetshwayo, to be opposed to their interests. In 1878, he refused to accept an ultimatum to submit to British rule. Great Britain reacted to this refusal by attacking Zululand in 1878. Although the Zulu inflicted serious defeats on them, the British conquered the Zulu in July 1879. In 1897, the Zulu successfully annexed Zululand because of their continued resistance to British rule and the number of raids they staged against the British.

The Anglo-Zulu War began on January 11, 1879. The British sent about 15,000 troops into Zululand. There were about 7,000 British regulars, 7,000 conscripted African troops, and about 1,000 colonial volunteers. The attack took place at the sacred time of the First Fruits festival. Cetshwayo had his entire army of about 30,000 assembled at Lundy for the festival. He attacked and defeated the British and then sued for peace. He had refrained from killing civilians and invading Natal.

The Zulu inflicted the greatest defeat that any European army had ever encountered at the hands of an African force. Almost every soldier died. The British refused to allow any peace to be negotiated and sought revenge. In July 1879, they burned Lundy, the royal homestead, and captured the king.

There was a close relationship between the power of the Zulu king, religion, and military organization. Shaka built on both Zulu religion and the sacred nature of the chief to supplement his military reorganizations. So powerful did he make the Zulu people and their military that the Zulu came close to driving the British from Natal and caused great discontent in Great Britain regarding the colonial endeavor in South Africa.

Zulu religion stresses the age-grade system, the importance of cattle, and the importance of matrilineal ties. These ties stretch back to ancestors from whom the elders descend and whose authority they wield. The belief system centers on ancestor worship, and this strengthens ties in the group and the power of the king. The king is in charge of all magic, rain-making, and other significant rights, all of which activities increase his power.

Shaka's heirs as priests and shamans as well as sacred people commanded a great deal of respect. They were able to harass the British and Boers until the end of the 19th century and have proved a force to be reckoned with during the end of White rule in

South Africa. Much of their cohesion has come from their knowledge of their traditional customs and religion. Their reverence for the old and willingness to adapt to changing times, a part of their tradition, has enabled them to continue as an essential part of South Africa's future.

Religious Ideas

There is a close relationship between Zulu religious ideas and their prowess in war. The Zulu have a belief in a Supreme Being, called *Unkulunkulu*. Some scholars argue that the term originally referred to the first man. In any case, Zulu use the term to refer to the Ancient One who has created all things and who is also the ancestor of humans. This Ancient One organized human societies. Additionally, the Zulu use the term "Lord of heaven" or "Chief in the Sky." This term refers to a Storm God.

There are also other supernatural agents, including animal spirits and sacred snakes, that aid in rain-making. They also have a female spirit, *Inkosazana*. *Inkosazana* aids in the growing of corn. There are rituals, performed by young women in the spring, to celebrate her power.

In common with other related peoples, the Zulu regard the chief as the symbol of tribal unity. The chief is a priest and sorcerer. He is the ruler and lawgiver of his people. He is also general and source of wealth. Under Shaka, the king became godlike. Simply put, he was a sacred being before whom his people prostrated themselves. He was a demigod and passed on this persona to his heirs.

Despite these views, people could and did abandon the king: Coups could take place, even civil wars. For example, the king's enemies assassinated Shaka. Provocation for these actions had to be great and both the Boers and the British learned how to foment and abet such provocation.

The First Fruits festival is an important ceremonial time for the Zulu. It is a time of the gathering of a large number of people. Diviners, herbalists, and other ritual specialists gather, and the sense of unity of the power of the king was enhanced by these ritual ceremonies.

Christianity came into Zululand in 1835 with Christian missionaries of many denominations. In 2000, about 50% of the people were Christians. Most of these people belong to African Independent Churches. However, there are Zulu Catholics,

Anglicans, members of the Dutch Free Church, and other Christian denominations. Most of these Christians also observe traditional religious practices along with Christian ones. Thus, the nationalistic notions of traditional religion get absorbed into Christianity in the Zulu area.

ZUNI INDIANS

The Amerindians known as the Zuni, Zuñi, or Aashiwi (as they call themselves) number slightly more than 10,000. Their 640-square-mile reservation is located in the valley of a tributary of the Little Colorado River high in the rugged plateau country of western New Mexico. The main village, or Zuni

Pueblo, known to its inhabitants as *Halona Itiwan'a*, “Middle Ant Hill of the World,” is situated on land that has been continuously occupied by them for at least 900 years and legally granted to them by the King of Spain in 1689.

Culturally, the Zunis are similar to other Pueblo groups. They have been described as the most traditional and most widely known of all the Southwestern Indian groups. Their social organization is matrilineal, with many exogamous matrilineal clans. The Zuni language is classified by linguists as a separate linguistic stock, called Zunian, which is distinct from the languages spoken by all the other Pueblos and the nearby Navajo and Apache.

Zunis trace their ancestry to the builders of the ruins of Mesa Verde, Chaco Canyon, and Canyon de Chelly. These settlements flourished in the 10th through the 12th centuries. No one knows exactly when Zuni Pueblo itself was settled, but it is known to have been well established when the Spanish arrived in 1539. In 1680, the Zunis joined with their pueblo neighbors in an uprising against the Spanish. Although the uprising was successful, by 1692 the Spanish reasserted their authority with acts of legendary brutality. During the uprising the Zuni withdrew into the surrounding mountains and returned to the valley after the reconquest. They soon rebuilt their multistoried pueblo of flat stone and adobe with tall outer walls. On the grounds immediately outside these walls they created gardens, laid out in a waffle pattern to preserve the river water they used in irrigation. Beans, melons, onions, cilantro, and chili flourished in these gardens.

Their multistoried dwellings were built around courtyards with narrow alleys that allowed passage throughout the town. These courtyards were the main sites of religious dances. Also important to Zuni ceremonial life were *kivas*, small rooms within the pueblo where members of medicine societies held meetings and performed rituals. During public kachina dances participants dressed in costumes that included special clothing and paint, carried rattles and other noise-makers, and wore large sculpted masks that identified the dancers with ancestors as well as with characters in Zuni cosmology.

For two centuries after the Pueblo uprising, the Zuni continued a yearly cycle of farming, herding, and hunting, together with religious ceremonies. Spanish friars maintained a presence at Zuni and made many political and economic demands on the

Pueblo. The year before Mexican independence, which came in 1821, the mission was abandoned. At the end of the Mexican War, in 1848, Zuni Pueblo became incorporated into the United States, and in 1877 federal officials created the Zuni Reservation. In 1881 the Santa Fe Railroad reached Gallup, bringing a new era of non-Indian settlement. Missionaries and traders arrived, encouraging the Zunis to convert to Christianity and to raise cattle. In so doing, they introduced religious pluralism and a cash economy. Despite these radical changes, the fact that the Spaniards gave the Zuni legal title to their land, long before there was a United States, has proven to be important in their cultural survival. Throughout the American period, Zuni has been recognized as a

sovereign nation existing within the boundaries of the United States.

Beginning at the end of the 19th century, Zuni Pueblo served as a living laboratory for a generation of anthropologists who documented this pre-industrial society while simultaneously defining a new profession. Some believed it would quickly disappear, especially the collectors. But salvage ethnologists believed that they could rescue Zuni culture from the inevitable pollution that would come about from contact with American culture. Over a period of several decades, archaeologists and ethnographers collected thousands of Zuni artifacts, which they placed in the Smithsonian Institution in Washington, DC. They also produced a large body of rather speculative literature about Zuni culture before contact with the outer world.

Today Zunis are writing self-descriptions, whereas archaeologists and ethnographers have meanwhile realized that they are enmeshed in the narratives they themselves tell about other cultures. This recognition has created a shift in methodology whereby they use their everyday social skills in simultaneously experiencing, observing, and recording their own and others' interactions in real geographical space and historical time.

Although the Zuni economy is currently based primarily on cottage industries, mainly arts and crafts, some Zunis have found other employment in Gallup, New Mexico, and Flagstaff, Arizona. Forest firefighting brings additional income into the community, as do ranching, tribal-government employment, truck farming, cattle raising, and sheep herding. Zunis are bilingual, speaking their native language at home and English elsewhere. Some Zuni elders also speak Spanish, as well as other Pueblo languages and Navajo.

In the years since World War II, the Pueblo of Zuni has spread out from its center at Halona. Today a Zuni hospital, operated jointly by the BIA and the tribal government, and a branch of the University of New Mexico are located in the village. Modern building materials have taken the place of stone and adobe, two- and three-bedroom single-storied stand-alone homes spread out from the center of the village, and house trailers dot the landscape, providing inexpensive housing for young people. The choice of trailers instead of houses is dictated by the fact that they are the only kind of housing the banks in Gallup will finance because they can be moved off the reservation if a purchaser defaults on a loan. At the same time, the

tribal government is rebuilding the central plaza in the form of a more traditional multistoried pueblo. Although the village today suffers from the social ills common to rural small towns in America, the Zunis have managed to retain their land, their religion, their language, and their culture.
